University Drive Traffic Simulation Report

Durham-Orange Light Rail Transit Project

July 24, 2015

The NEPA Preferred Alternative for the D-O LRT Project would generally follow NC 54, I-40, US 15-501, and the North Carolina Railroad (NCRR) Corridor in downtown Durham and east Durham. The alignment would begin at UNC Hospitals, parallel Fordham Boulevard, proceed east on NC 54, travel north on I-40, parallel US 15-501 before it turns east toward the Duke University campus along Erwin Road, and then follow the NCRR Corridor parallel to NC 147 through downtown Durham, before reaching its eastern terminus near Alston Avenue. The alignment would consist of at-grade alignment, fill and cut sections, and elevated structures. In two sections of the alignment, Little Creek and New Hope Creek, multiple Light Rail Alternatives are evaluated in the DEIS.

This technical report contains information for all alternatives analyzed in the DEIS. However, pursuant to MAP 21, the Moving Ahead for Progress in the 21st Century Act (P.L. 112-141), a NEPA Preferred Alternative has been developed, which recommends C2A in the Little Creek section of the alignment, NHC 2 in the New Hope Creek section of the alignment, the Trent/Flowers Drive station, and the Farrington Road Rail Operations and Maintenance Facility.

University Drive Traffic Simulation Report

1. Executive Summary

The study segment in this University Drive Traffic Simulation Report is a 0.7-mile long corridor that runs parallel to Chapel Hill Boulevard in the South Square area of southwest Durham. The study segment extends along University Drive from Ivy Creek Boulevard in the southwest through to Shannon Road in the northeast. Two additional intersections on Pickett Road at Petty Road and Tower Boulevard were also analyzed in this report.

University Drive is a five-lane facility under City of Durham jurisdiction with two eastbound travel lanes and two westbound travel lanes with a center two-way left-turn lane. One LRT station is proposed near the intersection of University Drive and Martin Luther King Jr. Parkway. Three LRT alignment alternatives are proposed in the New Hope Creek area, however, the Locally Preferred Alternative (LPA) and the New Hope Creek Alternative 2 (NHC 2) have the same alignment along University Drive and therefore they are analyzed as one alternative for the purposes of the traffic analysis in this report. For the New Hope Creek 1 Alternative (NHC 1), the LRT runs along the eastern side of Martin Luther King Jr. Parkway from the north and then turns east along the north side of University Drive crossing Lyckan Parkway, and then transitions across the westbound University Drive lanes at Westgate Drive to occupy the center of the roadway before turning north at Shannon Road and following adjacent to Tower Boulevard north to cross Pickett Road. Under the NHC 2 and NHC LPA Alternatives, the light rail alignment enters University Drive from the north at Ivy Creek Boulevard/Snowcrest Trail, transitions to the center of University Drive and then exits to the north at Shannon Road and follows adjacent to Tower Boulevard north to cross Pickett Road.

Traffic analysis was conducted using Vissim. The following scenarios were analyzed in this report:

- Existing Conditions
- 2040 No-Build Conditions
- 2040 Build LRT Conditions Alternative 1 (NHC 1)
- 2040 Build LRT Conditions Alternative 2 (NHC 2/NHC LPA)

To address the vehicular traffic operations issues identified during the course of the Vissim analysis, this report recommends substantial roadway modifications such as additional through lanes on segments of University Drive and additional turn bays at intersections, which are presented in Table ES-1. With these modifications, the 2040 Build LRT Alternatives' Vissim results indicate that the majority of overall intersections will not result in traffic impacts according to NCDOT or City of Durham guidelines, and the majority of maximum queues would be contained within the proposed turn lanes as described in the following paragraphs.

It should be noted that the subject segment of University Drive is within an LRT station area and the station area is expected to be designated as a compact neighborhood with design district building standards. As such, it is important to balance roadway modifications to increase traffic capacity with the need to build a transportation network that is conducive to multi-modal travel, and is safe and inviting for people who are walking, riding bicycles, or riding transit both along University Drive and across it. Additional analyses and coordination with the City of Durham and NCDOT will be completed during the Engineering phase of the project in order to refine the recommendations contained in this report.

The Build LRT Alternatives Vissim analysis indicates that the anticipated delay and queue increases are primarily caused by three factors:

- Minimum green times and clearance intervals required increases for 2040 Build conditions due to larger intersection widths required to accommodate the LRT.
- Due to the proposed Park-and-Ride lot and multiple turn restrictions, future demand Build vehicular volumes will increase beyond the already substantial No-Build volumes for the eastbound University Drive left turn to Westgate Drive and several other critical movements at this intersection. These heavier build volumes are anticipated to worsen the bottleneck expected under No-Build Conditions along the University Drive corridor. Prior to the incorporation of mitigation measures, the eastbound University Drive left turn queues were observed to spill back to Martin Luther King Jr. Parkway and would frequently block the southbound Martin Luther King Jr. Parkway left turn and eastbound University Drive through traffic at Martin Luther King Jr. Parkway.
- Signal preemption events would interrupt signal coordination along University Drive due to LRT operations. The signal preemption that allows the LRT to travel through intersections without stopping would incur delay for conflicting movements; however, decreasing signal LRT priority by allowing LRV stops at signalized intersections would not noticeably improve vehicular operations as the same conflicting vehicular phases must be stopped during the LRT crossing.

As noted previously, the roadway modifications presented in Table ES-1 are recommended to address these traffic operations issues.

The overall intersection results of the No-Build versus Build Vissim analysis are shown in Table ES-2. The majority of intersections would operate in accordance with NCDOT and City of Durham standards under the Build LRT Alternatives with the roadway modifications recommended in Table ES-1. Only under the NHC 2/NHC LPA Alternative is a single overall intersection expected to be considered a traffic impact:

- University Drive at Martin Luther King Jr. Parkway (NHC 2/NHC LPA), which is expected to degrade from LOS D to LOS E in the AM peak hour

The Vissim results also indicate that the traffic impacts and operational efficiencies are comparable at most of the intersections along University Drive and Pickett Road between the NHC 1 and NHC 2/NHC LPA alternatives. There are several more individual movements that report delay and maximum queue impacts along University Drive at Ivy Creek Boulevard, Larchmont Road, and Martin Luther King Jr. Parkway due to the alignment of the LRT under NHC 2/NHC LPA Alternatives.

Maximum queues would exceed available storage in several locations; however these are considered infrequent occurrences and additional roadway modifications are not recommended at these locations due to the limited operational benefits that would require large capital expenditures via impractical right-of-way acquisitions and would further increase roadway widths. Many of the turn bay maximum queues would also be contained within their overall approaches' storage space and therefore would not impact upstream intersections. For both alternatives, the expected average queues would be accommodated by the available storage at all locations except for the westbound University Drive through movement at Martin Luther King Jr. Parkway in the PM peak hour for Alternative 1, the westbound University Drive right turn at Martin Luther King Jr. Parkway in the PM peak hour under Alternative 2, the southbound Martin Luther King Jr. Parkway left turn at University Drive in the AM

University Drive Traffic Simulation Report

peak hour for Alternative 2, and the northbound Westgate Drive left turn at University Drive in the PM peak hour under Alternative 2. However, all of these average queue lengths mentioned above exceed the respective storage space by 10 feet or less.

As noted previously, extensive mitigation measures were incorporated into the LRT designs including additional University Drive through lanes and new turn bays, and additional roadway expansion is not recommended. Additional analysis of traffic impacts and the potential for additional traffic diversion from University Drive may be investigated during the Engineering phase of the project. In addition, proposed roadway modifications will be coordinated with the Durham City-County Planning Department during the Engineering phase to incorporate the forthcoming urban street standards for compact design districts. Other non-geometric mitigation strategies will also be explored by Triangle Transit and coordinated with the City of Durham, including evaluation and development of Travel Demand Management programs to encourage further mode shifts from personal automobiles to transit and non-motorized travel in the station areas.

Table ES-1: LRT Alternatives Proposed Roadway Modifications

Intersection	Roadway Modification
University Drive and Ivy Creek Boulevard/Snowcrest Trail (NHC 2 / NHC LPA)	Add eastbound University Dr through lane from Ivy Creek Blvd to Martin Luther King Jr. Pkwy. Restripe eastbound University Dr right turn lane to a shared eastbound through/right lane.
	Add a dedicated westbound University Dr right turn bay
Larchmont Road at University Drive (NHC 2 / NHC LPA)	Convert Larchmont Rd leg to right-in/right-out
	Prohibit eastbound University Dr left turn onto Larchmont Rd
	Construct connector between Snowcrest Trail and Larchmont Rd
University Drive and Martin Luther King Jr. Parkway	Extend westbound University Dr right lane upstream to commercial driveway west of Westgate Dr (NHC 1)
	Extend westbound University Dr right lane upstream to Westgate Shopping Center driveway (NHC 2 / NHC LPA)
University Drive and Lyckan Parkway	Convert Lyckan Pkwy and Parkway Plaza driveways to right-in/right-out only (NHC 2 / NHC LPA)
University Drive and Westgate Drive	Add second dedicated eastbound University Dr left turn bay
	Extend the outer eastbound University Dr left turn bay upstream to Martin Luther King Jr. Pkwy to create three eastbound lanes east of Martin Luther King Jr. Pkwy and four eastbound approach lanes at Westgate Dr
	Restripe the existing shared westbound University Dr through/right turn lane to a dedicated westbound through lane only
	Add dedicated westbound University Dr right lane and extend upstream to Westgate Shopping Center driveway
University Drive and Westgate Shopping Center	Convert north and south shopping center driveways to right-in/right-out only between Westgate Dr and Shannon Rd (impacts one leg on the north side and four legs on the south side of University Dr)
Pickett Road and Tower Boulevard	Signalize intersection
	Add dedicated northbound Tower Blvd right turn bay

2. Introduction

Through the Alternatives Analysis (AA) process completed in April 2012 prior to preliminary design, which included extensive public outreach, a Locally Preferred Alternative (LPA) was selected to address the purpose and need of the Durham-Orange (D-O) Corridor. The proposed project is a 17.1 mile double-track light rail transit (LRT) line with 17 proposed stations that will greatly expand transit service in Durham and Orange Counties. The Durham-Orange Light Rail Transit (D-O LRT) project extends from its western terminus at the University of North Carolina at Chapel Hill (UNC) at the UNC Hospitals Station to the eastern terminus in Durham at the Alston Avenue Station. The proposed D-O LRT Project improves public transportation access to a range of educational, medical, employment, and other important activity centers, in the D-O Corridor including: UNC; UNC Hospitals; the William and Ida Friday Center for Continuing Education; Duke University; Durham Veterans Affairs (VA) Medical Center and Duke University Medical Center (DUMC); downtown and east Durham.

2.1 Description of the Proposed D-O LRT

The proposed D-O LRT alignment generally follows North Carolina (NC) Highway 54 (NC 54), Interstate 40 (I-40), United States (US) 15-501, and the North Carolina Railroad (NCRR) Corridor in downtown Durham and east Durham. The proposed alignment begins in Chapel Hill at UNC Hospitals, parallels Fordham Boulevard, proceeds eastward adjacent to NC 54, travels north along I-40, parallels US 15-501 before it turns east towards Duke University and runs within Erwin Road, and then follows the NCRR Corridor that parallels NC Highway 147 (NC 147) through downtown Durham, before reaching its eastern terminus in Durham near Alston Avenue. A total of 17 stations are planned, and approximately 5,000 parking spaces along the D-O LRT alignment will be provided. In addition, a rail operations and maintenance facility (ROMF) will be constructed to accommodate the D-O LRT fleet.

Bus routes will be modified to feed into the D-O LRT stations and headways will be adjusted to provide more frequent service and minimize transfer waiting times. These services will also connect LRT passengers with other area transportation hubs, including park-and-ride lots and transfer centers.

2.2 Proposed Project Alternatives

The Draft Environmental Impact Statement (DEIS) will examine the potential environmental impacts of the LRT alternative as well as a small number of alignment, station, and ROMF siting Alternatives, including the following:

- Crossing of Little Creek between the Friday Center and the proposed Leigh Village Development (i.e., Alternatives C1, C1A, C2, C2A and associated station location)
- Crossing of New Hope Creek (NHC) and Sandy Creek between Patterson Place and South Square (i.e., NHC LPA and NHC Alternatives 1 and 2 and associated station locations)
- Station Alternatives at Duke and Durham VA Medical Centers
- Five proposed locations for the ROMF

In addition to the LRT, the DEIS will consider a No-Build alternative, which includes the existing and programmed transportation network improvements, with the exception of planned rail improvements and associated bus network modifications.

2.3 Purpose of University Drive Traffic Simulation Report

The roadway network is a critical element of the transportation network, serving as a means to safely move people and goods and to support the economic development of an area. In an effort to balance safety and mobility with economic development and access, many owners of public roads have developed standards for determining the impacts of development on the roadway network and the level to which those impacts must be mitigated. The standards and mitigation levels governing projects in Durham and Orange Counties of North Carolina have been identified in the *Traffic Analysis Methodology Report* included in Appendix A.

The purpose of this technical memorandum is to analyze the traffic operations for the University Drive section of the proposed D-O LRT in light of the policies identified in the *Traffic Analysis Methodology Report*.

The goal of the study is to provide decision makers with an evaluation of the ability of the transportation system to accommodate the future travel demand and to help determine which improvements are necessary to accommodate that demand. As noted previously, improvements to the roadway network will be included in this evaluation to determine if reasonable improvements can be made to accommodate the forecasted traffic volumes for 2040 in accordance with the guiding policies. This study will also aim to determine which projects are necessary to accommodate the background growth in traffic and which are necessary to mitigate any additional impacts caused by the proposed D-O LRT project.

2.4 University Drive Traffic Simulation Description

This report describes the approach and summarizes the findings and results of the traffic analysis conducted on the section of the D-O LRT alignment for the University Drive Segment. The study segment of University Drive is a 0.7-mile long corridor and includes four signalized intersections and three stop controlled intersections. In addition, two intersections along Pickett Road were also analyzed as part of this study. Figure 1 depicts the University Drive segment and study intersections in context with the regional transportation system.

Two LRT alternatives (NHC 1 and NHC 2/NHC LPA) are analyzed in the following:

- Crossing University Drive at Westgate Drive and Shannon Road (NHC 1)
- Crossing University Drive at Ivy Creek/Snowcrest Trail and Shannon Road (NHC 2/NHC LPA)
- LRT Station on University Drive east of Martin Luther King Jr. Parkway.
- Crossing of Pickett Road west of Tower Boulevard (both NHC 1 and NHC 2)

University Drive is a major corridor that runs next to US 15-501 and US 15-501 Business and serves local traffic within the South Square area in the City of Durham. Based on the preliminary designs shown in Appendix B, the NHC 1 Alternative would proceed south from US 15-501 towards University Drive along the eastern side of Martin Luther King Jr. Parkway, turning east to run along the north side of University Drive and crossing Lyckan Parkway. The LRT would cross the westbound University Drive lanes at Westgate Drive to run in the center of University Drive until Shannon Road, where the LRT would then proceed north along the eastern side of Shannon Road, continue north across 15-501 Business on elevated tracks and then run parallel to Tower Boulevard to cross Conifer Glen Lane and Pickett Road.

University Drive Traffic Simulation Report

Under the NHC LPA Alternative and NHC 2 Alternative, the light rail alignment would intersect with University Drive at Ivy Creek Boulevard in the southwest side and leave the corridor at the intersection of University Drive and Shannon Road on the northeast side. The LRT alignment is to run in the center of University Drive between Ivy Creek Boulevard and Shannon Road. A total of seven intersections along University Drive would be impacted due to the implementation of the LRT. These intersections include University Drive at Ivy Creek Boulevard, Larchmont Road, Martin Luther King Jr. Parkway, Lyckan Parkway, Westgate Drive, Westgate Shopping Center, and Shannon Road.

In terms of the LRT's signal operation, for the purpose of this analysis it was assumed that traffic signals along University Drive, Shannon Road, and Pickett Road will be programmed to operate with traffic signal preemption. Traffic signal preemption takes place when traffic signal timing is interrupted to allow trains to remain on schedule. In the case of University Drive, it is assumed the normal traffic signal timing is altered to allow the train to proceed uninhibited. While the train is in the intersection, all conflicting movements must stop although traffic traveling parallel to the tracks can proceed with the train. Any difference in signal phase length as a result of the passing train is made up within one traffic signal cycle after the train passes (a traffic signal phase is the combination of movements running together at the same time). Transit signal preemption was used for this analysis because it provides the greatest travel time savings to the LRTs by providing reliable green phases along University Drive segment and is also the most conservative operation for general traffic. Triangle Transit will work with NCDOT and the City of Durham to develop signal plans for each intersection during the Engineering phase of the D-O LRT project. The signal plans will incorporate signal preemption or transit signal priority. The difference between signal priority and signal preemption is that signal priority modifies the normal signal operation process to accommodate transit vehicles, while preemption interrupts the normal process for special events such as an approaching train. Transit signal priority extends the signal phase for the LRT and any non-conflicting vehicular phase(s), e.g. green or red light will only be lengthened or shortened by 15 seconds. This method of operation is not preferred by Triangle Transit since it would severely compromise the travel time reliability of the light rail operations which would have a negative impact on ridership.

University Drive is a four lane divided facility. One LRT station is proposed for implementation along this section of the project. The LRT station is proposed to be located on University Drive at the east side of Martin Luther King Jr. Parkway. Figure 1 shows the study intersections, the LRT station alternatives along the University Drive segment, and the LRT alignments for the two Build options (NHC 1 and NHC 2/NHC LPA).

The following intersections were analyzed in the Vissim models:

- University Drive and Ivy Creek Boulevard/Snowcrest Trail (Signalized)
- University Drive and Larchmont Road (Unsignalized)
- University Drive and Martin Luther King Jr. Parkway (Signalized)
- University Drive and Lyckan Parkway (Unsignalized)
- University Drive and Westgate Drive (Signalized)
- University Drive and Westgate Shopping Center (Unsignalized)
- University Drive and Shannon Road (Signalized)

University Drive Traffic Simulation Report

- Pickett Road and Petty Road (Signalized)
- Pickett Road and Tower Boulevard (Unsignalized)

The implementation of LRT along the University Drive corridor would require the reconstruction of the roadway with numerous specific design features from Ivy Creek Boulevard to Shannon Road.

Figure 1. University Drive Study Intersections

University Drive Traffic Simulation Report

Synchro Version 8.0 was used to develop optimized signal timing plans for the signalized intersections for existing, 2040 No-Build and Build conditions.

To analyze the potential impacts brought by the LRT, Vissim micro-simulation models were developed to cover the area of the LRT corridor and the intersections of interest. The models aim to capture the direct impact of the LRT operation to the roadway system during both the 2040 weekday AM and PM peak hours. The LRT is assumed to enter the network from both eastbound and westbound directions concurrently and operate with 10 minute peak period frequencies. Every LRT train is assumed to have 20 seconds of dwell time at the Martin Luther King Jr. Parkway Station for passenger boarding and alighting. In this area, the LRT was assumed to operate at a speed of 30 mph with a 20 mph turning speed based on preliminary designs. In order to minimize LRT delay and improve LRT operational efficiency and schedule adherence, a signal preemption system was configured so that the light rail vehicles would pass the signalized intersections along the University Drive segment without a stop.

3. Analysis Scenarios

Four scenarios were analyzed for this study including Existing Conditions, 2040 No-Build, and two Alternatives (NHC 1 and NHC 2/NHC LPA) for 2040 Build Conditions. A brief description of the scenarios evaluated in the Vissim microscopic traffic simulation software follows.

3.1 2011 Base Year Scenario

The 2011 Base Year Scenario simulated traffic conditions as they existed in 2011. The goal of the 2011 Base Year Scenario was to develop a calibrated model that would serve as the basis for the creation of the models for future year 2040 No-Build and Build scenarios. As discussed in the *Traffic Analysis Methodology Report*, travel time and speed were calibrated.

3.2 2040 No-Build Scenario

The 2040 No-Build scenario determined what the traffic operations would be in the vicinity of the proposed D-O LRT project if the proposed LRT project is not constructed. The No-Build Alternative assumed the local transportation system would evolve as currently planned, but without implementation of the proposed LRT project and associated improvements. Traffic volumes for the base year were projected to the year 2040 and incorporated into the existing base models. Signal timing plans were optimized in Synchro to best accommodate the 2040 peak hour traffic volumes and incorporated into Vissim for the operational analysis.

3.3 2040 Build Scenario

The 2040 Build scenarios determined what the traffic operations would be in the vicinity of the proposed project if the light rail and LRT stations are constructed along the University Drive segment.

The 2040 Build analysis was based on a preliminary design as well as the currently planned improvements within the study area. The roadway geometry and LRT alignments for Alternative 1 (NHC 1), Alternative 2 (NHC 2), and the NHC LPA are shown in the *Basis for Engineering Design* plans in Appendix B.

Under both options, LRT is proposed to run in the center of University Drive with one LRT station located on the east side of Martin Luther King Jr. Parkway for this segment. The difference between these two alternatives is that the LRT intersects the University Drive at Westgate Drive and Shannon Road respectively for Alternative 1 (NHC 1) while at Ivy Creek Boulevard and Shannon Road respectively for Alternative 2 (NHC 2 / NHC LPA).

In terms of the LRT's signal operation, for the purpose of this analysis it was assumed that traffic signals along University Drive will be programmed to operate with traffic signal pre-emption. Traffic signal pre-emption takes place when traffic signal timing is interrupted to allow trains to remain on schedule. In the case of University Drive, it is assumed the normal traffic signal timing is altered to allow the train to proceed uninhibited. While the train is in the intersection, all conflicting movements must stop although traffic traveling parallel to the tracks can proceed with the train. Any difference in signal phase length as a result of the passing train is made up within one traffic signal cycle after the train passes.

University Drive Traffic Simulation Report

As the LRT route is proposed to be constructed in the center of University Drive, the improvements recommended to accommodate this alignment include widening the signalized intersections to the north and south, converting stop-controlled intersections to right-in and right-out access, and adding left-turn lanes to provide feasible volume-to-capacity ratios. The proposed specific roadway modifications at each intersection are listed in Table 1 for the two LRT Build Alternatives.

Table 1: Build LRT Alternatives - Recommended Roadway Modifications

Intersection	Roadway Modification
University Drive and Ivy Creek Boulevard/Snowcrest Trail (NHC 2 / NHC LPA)	Add eastbound University Dr through lane from Ivy Creek Blvd to Martin Luther King Jr. Pkwy. Restripe eastbound University Dr right turn lane to a shared eastbound through/right lane.
	Add a dedicated westbound University Dr right turn bay
Larchmont Road at University Drive (NHC 2 / NHC LPA)	Convert Larchmont Rd leg to right-in/right-out
	Prohibit eastbound University Dr left turn onto Larchmont Rd
	Construct connector between Snowcrest Trail and Larchmont Rd
University Drive and Martin Luther King Jr. Parkway	Extend westbound University Dr right lane upstream to commercial driveway west of Westgate Dr (NHC 1)
	Extend westbound University Dr right lane upstream to Westgate Shopping Center driveway (NHC 2 / NHC LPA)
University Drive and Lyckan Parkway	Convert Lyckan Pkwy and Parkway Plaza driveways to right-in/right-out only (NHC 2 / NHC LPA)
University Drive and Westgate Drive	Add second dedicated eastbound University Dr left turn bay
	Extend the outer eastbound University Dr left turn bay upstream to Martin Luther King Jr. Pkwy to create three eastbound lanes east of Martin Luther King Pkwy and four eastbound approach lanes at Westgate Dr
	Restripe the existing shared westbound University Dr through/right turn lane to a dedicated westbound through lane only
	Add dedicated westbound University Dr right lane and extend upstream to Westgate Shopping Center driveway
University Drive and Westgate Shopping Center	Convert north and south shopping center driveways to right-in/right-out only between Westgate Dr and Shannon Rd (impacts one leg on the north side and four legs on the south side of University Dr)
Pickett Road and Tower Boulevard	Signalize intersection
	Add dedicated northbound Tower Blvd right turn bay

4. Methodology

The analysis followed the methodology documented in the *Traffic Analysis Methodology Report* for the Durham-Orange Light Rail Project developed in November 2013. Two traffic analytical software tools, Synchro and Vissim, were used to provide measures of effectiveness (MOE) necessary for the analysis. This study used Synchro Version 8.0 to develop optimized signal timing plans as input for microscopic simulation modeling.

The use of microscopic traffic simulation was completed using Vissim (version 5.4). Vissim is a microscopic, behavior-based multi-purpose traffic simulation program that evaluates each vehicle individually every model time step and then assigns the appropriate behavior logic according to the traffic operations that the specific vehicle encounters. For many engineering disciplines, simulation has become an indispensable instrument for the optimization of complex technical systems. This is also true for transportation planning and traffic engineering, where simulation is an invaluable and cost-reducing tool. The microscopic simulation model was developed for the studied section of the project and was based on a calibrated base model for the area.

The methodology for microscopic simulation begins with a base model developed from data collected for the transportation network. The base model is then calibrated against data measured in the field to arrive at a calibrated base model. Once the base model is calibrated, future year alternatives can be developed and analyzed for impact study. As in real-life operations, microscopic simulation models are constrained to the capacity of a given roadway, and as such the model can only load traffic up to the capacity of a facility, with excess vehicles being denied entry and queue up outside the model network. This can happen for future scenarios when demand has been forecasted to outgrow the capacity of the existing roadways.

4.1 Measures of Effectiveness (MOE)

Measures of effectiveness (MOE) are system performance statistics that best characterize the degree to which a particular alternative meets the project objectives. The MOEs for microscopic simulation can be abundant due to the nature of the analysis. The primary MOEs for urban arterials are typically average speed and vehicle density for individual segments as well as average travel time and speed for individual origin-destination pairs within the network. On an overall network level, MOEs such as average system speed, average system delay, and number of stops can provide overall indications of the operations of a network.

As discussed in the *Traffic Analysis Methodology Report*, corridor-level MOEs including average speed and travel time were used as the method for calibrating the base year model. Control delay, which is utilized to determine intersection LOS, and queuing were the MOEs for the future year models. The concept of Highway Capacity Manual's (HCM) Level of Service was adopted here for the purpose of simply categorizing the delays. Please note that the calculation methods of HCM delay and Vissim delay are different, as Vissim delay includes control delay as well as queue delay, whereas, HCM includes control delay only. The LOS grades are based on Vissim delays, which will provide a more conservative result than the HCM-based delays.

The acceptable levels for the future year MOEs were enumerated in the *Traffic Analysis Methodology Report*. Both NCDOT and City of Durham have established guidelines that specify when chosen MOEs meet the required thresholds. These criteria set thresholds for MOEs to define whether a traffic impact

University Drive Traffic Simulation Report

should be considered for mitigation. It should be noted that NCDOT’s criteria were used to determine traffic impact only for the intersection of University Drive at Martin Luther King Jr. Parkway. For all other intersections in the study area, the City of Durham – Compact Neighborhood criteria were used as shown in Table 2 below.

Table 2: City of Durham Traffic Level of Service Standards

Application	Level of Service Standard
Downtown Tier	LOS E
Compact Neighborhood Tier	LOS E
Urban Tier	LOS D
Suburban Tier	LOS D
Rural Tier	LOS C

The City of Durham – Compact Neighborhood traffic impact criteria from the table above were applied with the following thresholds:

- Build movements that degrade to LOS F should be considered an impact (unless the No-Build movement also reports LOS F; if the No-Build movement reports LOS F, the movement should be considered an impact if the delay increases by 25% or more).
- Any build movement queue that exceeds the No Build queue length and also exceeds the available storage space by more than 10 feet should be considered an impact.

For the purposes of this analysis, any analysis result that exceeded the City of Durham criteria was highlighted in the Vissim Build vs No-Build Comparison tables with orange.

The NCDOT’s “Policy on Street and Driveway Access to North Carolina Highways” states that when comparing base network conditions to project conditions, mitigation measures must be identified if at least one of the following conditions exists:

- The total average delay at an intersection or an individual approach increases by 25% or greater, while maintaining the same Level of Service
- The Level of Service degrades by at least one level
- Or Level of Service is F
- For turning lanes, mitigation improvements shall be identified when the analysis indicates that the 95th percentile queue exceeds the storage capacity of the existing lane.

For the purposes of this analysis, for intersections subject to NCDOT criteria, traffic impacts were considered for mitigation if the Build Alternative delay was at or above a middle LOS D or 45.0 seconds or greater at University Drive and MLK Jr. Parkway. Those overall intersections or movements that reported delays greater than 45.0 seconds and experienced an LOS degradation or increase in delay greater than 25% compared to the No-Build were highlighted in the Vissim LOS tables with orange. For those intersections or movements that reported a Build LOS better than middle D or less than 45.0 seconds, the impacts would not warrant roadway modifications and were highlighted with yellow.

University Drive Traffic Simulation Report

To be considered a queue impact, movements were highlighted with orange where the maximum queue length for any Build movement would exceed both the respective No-Build movement’s maximum queue length and the build movement storage length by 10 feet.

In summary, Table 3 shows the traffic impact criteria applied to the various study intersections.

Table 3: Application of Traffic Impact Criteria

Segment	Location	Criteria Applied
University Drive	Martin Luther King Jr. Parkway	NCDOT
	All Other Intersections	City of Durham – Compact Neighborhood
Pickett Road	Petty Road and Tower Boulevard	City of Durham – Compact Neighborhood

4.2 Network Development

4.2.1 Geometry

The basis for developing the geometric data was a combination of aerial photographs and contour maps. Aerial photography was used as a background to digitize the network into the simulation model. The three-dimensional attributes and grades were determined based on a contour map of the study area.

The geometry in the 2014 Base Year network and the 2040 No-Build network are based on the current geometry of University Drive. The network was created using aerials from North Carolina OneMap, Google Maps, field verification, and contour maps from the NCDOT.

The proposed roadway geometry for 2040 Build Alternatives are described in Section 3.3.

4.2.2 Traffic Control

Signal and coordination plans were obtained from NCDOT for the four signalized intersections along University Drive and one signalized intersection on Pickett Road included in the study area. These plans were used to input timing, phasing, and detectors for the following intersections in the base year:

- University Drive and Ivy Creek Boulevard/Snowcrest Trail
- University Drive and Martin Luther King Jr. Parkway
- University Drive and Westgate Drive
- University Drive and Shannon Road
- Pickett Road and Petty Road

Field verification of the signal timings were performed by timing each signal phase and recording videos at each intersection. The existing signal timing plans and signal design files are located in Appendix C. For the future signal timings, minimum green times, yellow and all-red clearance intervals were based on build intersection geometry, the Institute of Transportation Engineers’ pedestrian phasing formula, and recommended traffic settings documented in the NCDOT Congestion Management Capacity

Analysis Guidelines. The signalized intersections for the future year networks were input into Synchro for optimization prior to being input into Vissim. The future year signal timings utilized the base year timings, which were re-optimized based on the 2040 forecasted traffic volumes and build geometry. The future year signalized intersections include the previously listed intersections. Cycle lengths, splits and offsets were optimized in Synchro for the study signalized intersections in the network prior to being input into Vissim where they were refined.

4.2.3 Speed Data

The average speed data for segments along the University Drive corridor were collected using the floating car technique during off peak periods with low volumes. This data was used to develop desired speed distributions for the network. Weekday peak periods speed data was collected from INRIX (a mobile application pertaining to road traffic). This data was used to determine the average speed during the peak periods from the approximate time the initial count data was collected. This data was used in calibration of the model. The desired speed distribution for turning vehicles at intersections was assumed to be a mean of 12 mph with a standard deviation of 1 mph for right turns and a mean of 20 mph with a standard deviation of 2 mph for left turns. The University Drive speed distribution used was 35 mph posted, with a range of 32 to 40 mph in Vissim.

4.2.4 Driving Behavior Parameters

The driver behavior parameters were used to guide vehicles through the network during the simulation models. Both the car-following and lane-change models in Vissim use an extensive range of parameters. Some of these may be adapted by the user to change basic driving behavior. Vissim uses five driving behavior models, of which only one was used in the base model; Urban (motorized). The Urban (motorized) parameters were used to model the surface streets within the network and based on the Wiedemann 74 model. The Wiedemann 74 model includes three parameters which can be calibrated based on the data collected. Initially, the default values were used in developing the base model and any modifications made to the parameters were documented in the calibration section of this report.

4.2.5 Estimated Traffic Volumes

To accurately model the network, peak hour volumes were developed into a balanced network for the proposed roadway geometry with LRT in the horizon year of 2040. The peak hour volumes were determined based on peak hour count data that was balanced along University Drive by adjusting through volumes and adding sink and source nodes to correspond to mid-block locations that could serve as origins and destinations of traffic. These locations included parking lots for commercial establishments as well as parking areas for residential development along the corridor.

Volumes for the 2011 Existing Condition were developed based on the 2011 count data. The projection of the future volumes for no-build and build conditions were based on Triangle Regional Travel Demand Model (TRM) v5 as outlined in the *Traffic Analysis Methodology Report*.

Due to the introduction of the LRT, including park-and-ride lots and a modal demand shift from personal vehicles to public transit, the 2040 No-Build and Build volumes were based on separate TRM roadway growth rates. Separate future 2040 Build balanced volumes were developed for Build NHC 1 and Build NHC 2 / NHC LPA along University Drive due to the conversion of Larchmont Road, Lyckan Parkway, and

University Drive Traffic Simulation Report

the ITT driveway to right-in/right-out access only, due to the presence of the LRT in the center of University Drive.

Volumes for the 2011 Bear Year, 2040 No-Build and the 2040 Build scenarios were created using the count data and the Triangle Regional Travel Demand Model (TRM) v5 as outlined in the *Traffic Analysis Methodology Report*. The balanced peak hour volumes are located in Appendix D.

4.2.6 Simulation Settings and Repetitions

Each simulation was run for one hour, with 15 minutes of start-up time for the network to load traffic before output recording was started.

The number of simulation runs was based on the process described in Appendix B of the Federal Highway Administration (FHWA) Traffic Analysis Toolbox Volume III. The average speed of each simulation run was used as a basis for determining the number of required repetitions, with a confidence level of 95% and a confidence interval of 5 mph. It was calculated that each alternative would need to be run with 10 random seeds for both the AM and PM peak hours.

4.2.7 Output

The output data was extracted from the model using the Travel Time evaluation, and the Intersection Node modules. The Travel Time evaluation provided average travel times for the corridor used for calibration of the 2011 Existing model. The Intersection Node module provided movement and intersection delay data which was utilized to determine the intersection LOS for the future year analysis models.

4.2.8 Base Year Calibration

The base year model was calibrated by comparing modeled travel times and speed versus historic INRIX speed and travel time data as described in the *Traffic Analysis Methodology Report*. INRIX speed data is collected by utilizing vehicle probes that collect and transmit the locations of probe vehicles within the network. Historic data was extracted for the University Drive within the study area for AM and PM peak hours. The average speed and corresponding travel time for each direction along the University Drive was determined from the data. It should be noted that INRIX speed data is composed of link-based speeds (as opposed to spot speeds taken at a fixed point); therefore, the model network was developed to match the same extents as the INRIX speed data.

For the calibration effort, the average travel time was determined by averaging a statistically adequate number (see section 4.2.6) of model runs. Speed calibration targets of +/- 2.5 mph (desirable) and +/- 5 mph (acceptable) were set as described in the *Traffic Analysis Methodology Report*.

5. 2040 Simulation Results

Based on the above model network elements and the methodologies defined under MOEs, the results from Vissim and Synchro can be determined.

5.1 2011 Existing Conditions

The 2011 Existing Conditions Vissim model was developed and calibrated, as described in Section 4.2.8 above. The INRIX speed data, taken from a 0.7 mile corridor along University Drive showed the following average speeds and corresponding travel times. The results of the calibrated base model are shown in Table 4 below.

Based on the data included in Table 4, two of the four modeled average speeds were within the desirable calibration limits of +/- 2.5 mph. The other was within the acceptable range of +/- 5 mph. The base model is therefore considered to be calibrated and can be utilized as the basis for developing the future year alternatives. In general, the speeds in the model were lower than those from the INRIX data.

Table 4: 2011 Existing Scenario – Base Model Calibration Results

Direction	Length (miles)	Peak Period	Calibrated Model		INRIX		Travel Time Difference (min)	Speed Difference (MPH)	Calibration Range
			Average Travel Time (min)	Average Speed (MPH)	Average Travel Time (min)	Average Speed (MPH)			
Eastbound (EB) Travel Time and Speed Summary									
EB Corridor Wide	0.7	AM	1.8	23	1.97	21	-0.2	2	Within Desirable
		PM	2.4	17	2.1	20	0.3	-3	Within Acceptable
Westbound (WB) Travel Time and Speed Summary									
WB Corridor Wide	0.7	AM	1.96	21	1.75	24	0.2	-3	Within Acceptable
		PM	2.59	16	2.73	15	-0.1	1	Within Desirable

5.2 2014 No-Build Scenario

The 2040 No-Build model was developed based on the calibrated existing base model for both AM and PM peak hours. Existing network geometry, optimized signal timing plans and volumes for 2040 No-Build conditions were input into the base model.

The Highway Capacity Manual defines LOS for signalized and unsignalized intersections as a function of the average vehicle control delay. LOS may be calculated per movement or per approach for any intersection configuration, but LOS for the intersection as a whole is only defined for signalized and all-way stop configurations. Table 5 and Table 6 demonstrate the different levels of service for signalized and unsignalized intersections based on delay and volume to capacity ratio.

Table 5: Level of Service – Signalized Intersections

Level of Service	Delay (seconds)	Description
A	≤10	This level is typically assigned when the volume-to capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.
B	>10-20	This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.
C	>20-35	This level is typically assigned when progression is favorable or the cycle length is moderate. Individual <i>cycle failures</i> (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. This number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.
D	>35-55	This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.
E	>55-80	This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.
F	>80	This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

University Drive Traffic Simulation Report

Table 6: Level of Service – Unsignalized Intersections

Level of Service	Delay (seconds)
A	≤10
B	>10-15
C	>15-25
D	>25-35
E	>35-50
F	>50

Table 7 lists turning movement volumes, delays, and LOS at intersections along University Drive and Pickett Road during AM and PM peak hours under 2040 No-Build conditions.

As can be seen from the results, all intersections except for Martin Luther King Jr. Parkway report overall intersection LOS of D or better. A number of individual movements are expected to operate at LOS E or F under the No-Build conditions. Martin Luther King Jr. Parkway is anticipated to operate at a LOS E during the PM peak hour. This is not unexpected as the corridor is anticipated to be capacity-constrained by year 2040 under the existing lane configurations. The results from the No-Build analysis suggest that a number of roadway modifications may be necessary on the University Drive segment for all intersections and movements to operate at LOS D or better, regardless of the presence of the LRT.

A 2040 No-Build Synchro-based model was developed to provide an initial set of future optimized signal timings for input into Vissim. The proposed network geometry and the 2040 No-Build volumes were then input into the model. The Synchro reports for all 2040 No-Build and Build scenarios can be found in Appendix E.

Synchro, however, cannot realistically model advanced signal timing operations including Traffic Signal Preemption or Transit Signal Priority. As such, the delays caused to general traffic by signal preemption events cannot be measured by Synchro and therefore those intersections equipped with this special signal operation would underreport vehicle delays.

Based on the results of the Vissim analysis, the following intersections are anticipated to operate at LOS E or LOS F in at least one No-Build peak hour:

- University Drive at Larchmont Road*
- University Drive at Martin Luther King Jr Parkway
- University Drive at Westgate Shopping Center*
- Pickett Road at Tower Boulevard*

* - Indicates unsignalized intersection with at least one movement operating at LOS F conditions.

It is important to note that these are No-Build background issues that should be addressed regardless of the potential D-O LRT project. This expected No-Build congestion may make it more difficult to meet the thresholds stated in NCDOT's "Policy on Street and Driveway Access to North Carolina Highways." Queue lengths that may already be lengthy in the No-Build condition could cause additional queuing resulting from the Build conditions to exceed the available storage space for a particular lane group.

5.3 2040 Build Scenario – NHC 1 Alternative

The Build Alternatives were analyzed in Vissim for the 2040 AM and PM peak hours to determine traffic operations for the University Drive segment assuming that the light rail facility is constructed. The 2040 LRT model for NHC 1 Alternative was developed based on the 2040 No-Build models, with the LRT entering University Drive at Westgate Drive, running in the center of University Drive and then continuing north on Shannon Road before crossing Pickett Road. The LRT station is located at the northeast corner of University Drive and Martin Luther King Jr. Parkway.

Vissim simulation and intersection MOE results indicated that Westgate Drive is a bottleneck for corridor operations specifically during the PM peak hour under NHC 1 Alternative conditions. The southbound Westgate Drive left turn and eastbound University Drive left turn traffic are substantial during the PM peak hour. Without substantial modifications to the roadway, movements are anticipated to operate at LOS F with extensive delays which then result in excessive queue lengths for both

eastbound and southbound approaches. The maximum queue lengths at the eastbound University Drive left turn bays extend upstream to Martin Luther King Jr. Parkway, which then blocks eastbound through traffic along University Drive and the southbound Martin Luther King Jr. Parkway left turn traffic.

Two different options were identified and evaluated to address this issue during the analysis process. The first strategy was to improve the eastbound University Drive left turn to northbound Westgate Drive capacity by adding two new left turn bays to provide triple eastbound left turn bays at Westgate Drive. The Vissim results indicated that the eastbound University Drive left turn at Westgate Drive would improve from LOS F to LOS E with a 30 second delay reduction. Although the southbound Martin Luther King Jr. Parkway left turn at University Drive would still be expected to operate at LOS F in the PM peak hour, the delay would decrease by 17 seconds with the triple eastbound University Drive left turn bay configuration at Westgate Drive. The overall intersection performance is anticipated to improve from LOS E to LOS D at University Drive and Martin Luther King Jr. Parkway.

Although the triple eastbound University Drive left turn bay at Westgate Drive concept would improve the traffic operations at the movement, intersection and corridor levels, it is not recommended based on consultation with NCDOT and City of Durham staff due to concerns regarding operational efficiency, vehicle and pedestrian safety, undesirable alignment, long pedestrian crossing times, and right-of-way impact.

The other option was to reduce the eastbound University Drive left turn volumes at Westgate Drive by diverting a portion of the volume to a different route, and using only two eastbound University Drive left turn lanes. This is based on an assumption that a subset of drivers will use alternative routes to avoid the extensive delays expected at the eastbound Westgate Drive left turn and rerouting to Shannon Road. A capacity calculation was used to determine the total number of vehicles to be reduced from the eastbound University Drive left turn movement and this volume is re-routed based on the weighted volumes from the according upstream movements at Martin Luther King Jr. Parkway and Ivy Creek Boulevard. It should be noted that the southbound Martin Luther King Jr. Parkway left turn traffic at University Drive was not re-routed, as an alternative route via US 15-501 Business already exists and is signed. Origin-Destination build volumes for the non-diverted two lane eastbound University Drive left turn NHC 1 Alternative and the diverted two lane eastbound University Drive left turn NHC 1 Alternative are shown in Appendix F.

The Vissim results indicate the major bottleneck at Westgate Drive would be alleviated and traffic operations would be improved at the movement, intersection and corridor levels. Although the eastbound University Drive left turn movement would remain the same LOS F as it is under the scenario with two eastbound University Drive left turn lanes without diversion, the eastbound congestion along University Drive was mitigated. In addition, the southbound Westgate Drive left turn was improved from LOS F to LOS E and the eastbound University Drive through movement was improved from LOS E to LOS D at Martin Luther King Jr. Parkway. The overall intersection performance was improved from LOS E to LOS D for both intersections in the PM peak hour.

The analysis results indicated that providing two eastbound University Drive left turn lanes and inducing some volume diversion from the eastbound approach at Westgate Drive is a recommended measure to mitigate the expected impact. Table 8 shows the intersection MOE comparisons between the 2040 No-Build and the NHC 1 Build Alternative Options that were evaluated.

University Drive Traffic Simulation Report

The roadway modifications associated with the two eastbound University Drive left turn bays and traffic diversion concept are recommended for the LRT design and analysis of the 2040 Build LRT NHC 1 Alternative and are listed in Table 1.

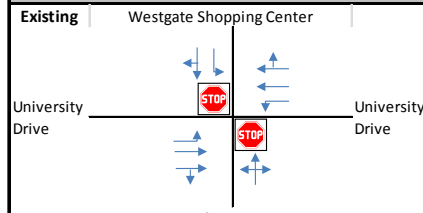

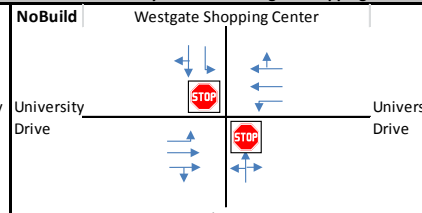

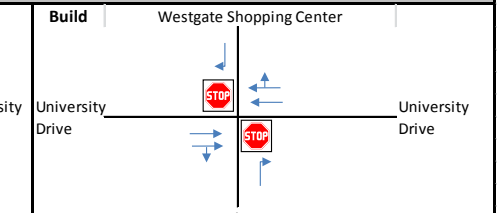

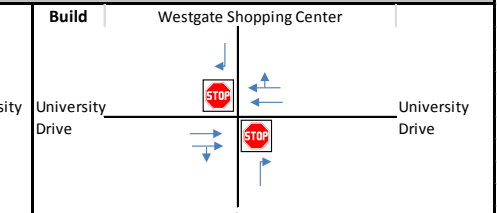

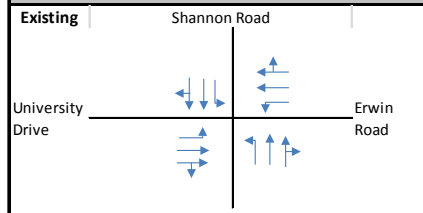

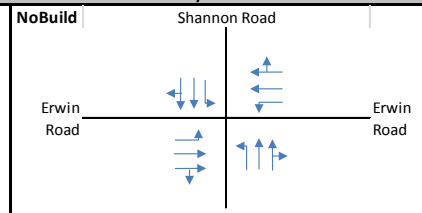

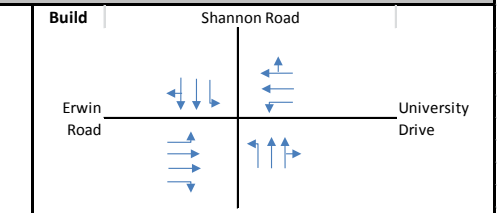

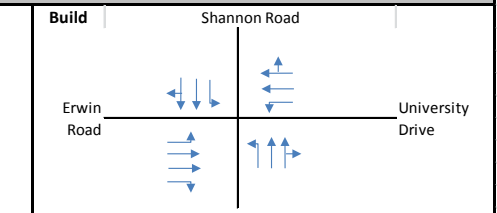

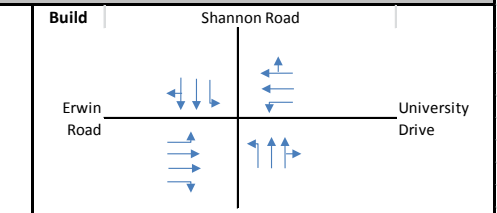

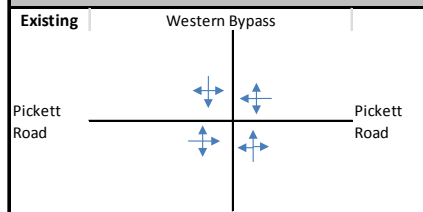

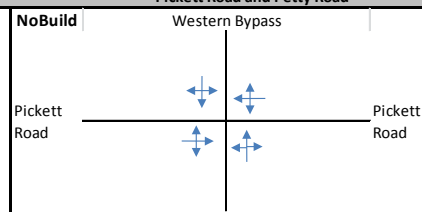

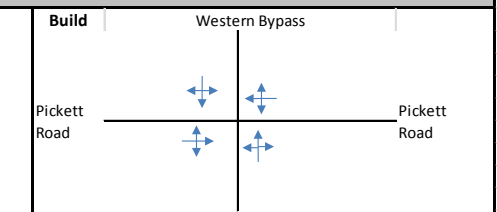

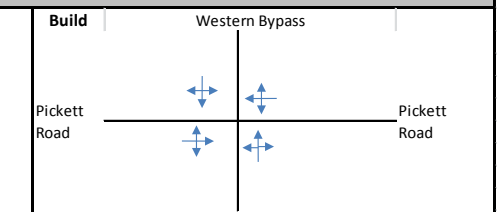

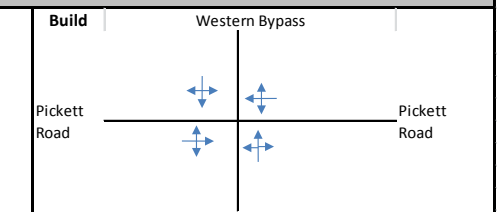

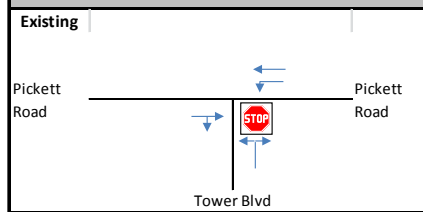

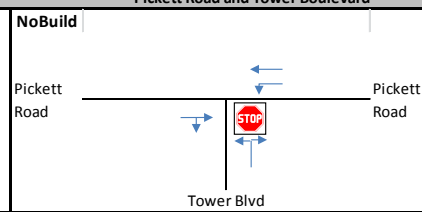

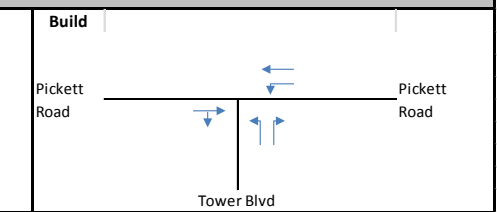

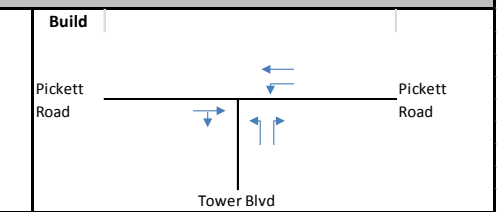

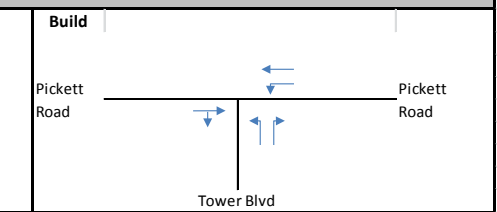

Intersection signal timing changes from 1) Existing to No-Build and from 2) No-Build to Build including traffic signal cycle length and phasing modifications are shown in Table 9 for LRT NHC 1 Alternative from University Drive and Ivy Creek Boulevard to Petty Road and Pickett Road. Table 9 also indicates the lane configuration modifications that are proposed between Existing to No-Build, and No-Build to Build Conditions.

5.4 2040 Build Scenario – NHC 2/NHC LPA Alternative

The 2040 LRT model for the NHC 2/NHC LPA Alternative was based on the 2040 No-Build models, with the LRT entering University Drive at Ivy Creek Boulevard, running in the center median along University Drive, and then continuing north on Shannon Road before crossing Pickett Road. The LRT station is located east of Martin Luther King Jr. Parkway.

Similar to NHC 1, Vissim simulation and intersection MOE results indicated that Westgate Drive will act as a bottleneck for corridor operations during both AM and PM peak hours under NHC 2/NHC LPA conditions. Without diversion, NHC 2/NHC LPA eastbound left turn volume was 641 vehicles per hour and 763 vehicles per hour during AM and PM peak hours, respectively, at Westgate Drive. Without substantial roadway modifications as part of NHC 2/NHC LPA Alternative, the eastbound University Drive left turn movement is anticipated to operate at a LOS F with extensive delays. This results in excessive queue lengths that extend upstream to Martin Luther King Jr. Parkway and blocks the eastbound through traffic along University Drive and the southbound Martin Luther King Jr. Parkway left turn traffic.

The same two options at Westgate Drive as noted for NHC 1 Alternative, (1) triple eastbound left turn bays and (2) dual eastbound left turn lanes with volume diversion, were evaluated in the analysis under NHC 2/NHC LPA Alternative traffic conditions for both AM and PM peak hours. The Vissim PM results indicate that eastbound left turn movement at Westgate Drive improves from a LOS F to LOS E with a range of 12 second to 26 second delay reduction. Even though the southbound left turn movement at Martin Luther King Jr. Parkway is still expected to operate at LOS F, the delay is expected to decrease substantially, by more than 100 seconds during the PM peak hour. It was observed that congestion due to the eastbound University Drive left turn delay was alleviated under both options.

Due to the same concerns of implementing triple left turn lanes discussed for the NHC 1 Alternative in Section 5.3, the option of implementing two eastbound University Drive left turn lanes and assuming a reasonable portion of eastbound left turn volume would divert is recommended for this analysis. The same method used for NHC 1 was applied to the NHC 2/NHC LPA analysis to determine the total number of vehicles to be reduced from the eastbound University Drive left turn at Westgate Drive and added to the eastbound University Drive left turn and northbound Shannon Road through movement at University Drive and Shannon Road. Origin-Destination build volumes for the non-diverted two lane eastbound University Drive left turn NHC 2/NHC LPA Alternative and the diverted two lane eastbound University Drive left turn NHC 2/NHC LPA Alternative are shown in Appendix F.

Table 10 shows the intersection MOE comparisons between the 2040 No-Build and Build scenarios being evaluated for PM peak hour which is the worst conditions in the traffic analysis.

The roadway modifications associated with the two eastbound University Drive left turn lanes and traffic diversion concept are recommended for the design and analysis of the 2040 LRT NHC 2/NHC LPA Alternative and are listed in Table 1.

Intersection signal timing changes from 1) Existing to No-Build and from 2) No-Build to Build including traffic signal cycle length and phasing modifications are shown in Table 11 for LRT NHC 2/NHC LPA Alternative from University Drive and Ivy Creek Boulevard to Petty Road and Pickett Road. Table 11 also indicates the lane configuration modifications that are proposed between Existing to No-Build, and No-Build to Build Conditions.

University Drive Traffic Simulation Report

6. Summary of Results

The following section summarizes the Vissim simulation results for the 2040 No-Build versus the two 2040 Build LRT Alternatives (NHC 1 and NHC 2/NHC LPA) in a side by side manner. Table 12 through Table 15 include individual movement and overall intersection delays, LOS and queuing information as reported by Vissim for all future scenarios.

6.1 Analysis of LOS Threshold

Based on the identified improvements all Build Alternative intersections are expected to operate at LOS E or better, which meets the City of Durham traffic impact criteria for 2040 Build conditions. However, queuing and increase in delay at movement level were also considered in determining if mitigation was warranted. The impacts at all the intersections along the University Drive and Pickett Road segments were assessed in regards to the City of Durham criteria except that the Martin Luther King Parkway was assessed based on the NCDOT criteria. The movements that do not meet the NCDOT thresholds or the City of Durham thresholds are listed and discussed below for each intersection.

6.1.1 University Drive at Ivy Creek Boulevard/ Snowcrest Trail

The City of Durham – Compact Neighborhood traffic impact criteria are applied to the intersection of University Drive at Ivy Creek Boulevard/Snowcrest Trail, as both roadways are under city jurisdiction. Due to alignment differences, the two Build LRT Alternatives report different delays, LOS, and queue lengths at this intersection. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection delays during both peak hours would meet the City of Durham thresholds.

For the LRT NHC 1 Alternative, all of the individual intersection movements are expected to meet the City of Durham thresholds in both peak hours. Under the LRT NHC 2/NHC LPA Alternative, the southbound Snowcrest Trail left turn is expected to degrade from a No-Build LOS E to Build LOS F.

For the 2040 LRT NHC 1 Alternative, the maximum queue length for the following movement will exceed both its available storage space and the respective peak hour No-Build maximum queue length by more than 10 feet:

- Northbound Ivy Creek Boulevard right turn exceeds storage space by 97 feet in PM only

For the NHC 1 Alternative, the northbound Ivy Creek Boulevard right turn queue is impacted due to downstream congestion at University Drive and Martin Luther King Jr. Parkway. Although the maximum queue length exceeds the northbound Ivy Creek Boulevard right bay storage space, it would be contained by the northbound approach before reaching the roundabout to the south. Additionally, the maximum queue events are considered infrequent occurrences, whereas the movement's average queue is expected to be far shorter and would be contained within the northbound right turn bay storage space.

For the 2040 LRT NHC 2/NHC LPA Alternative, the maximum queue length for the following movements will exceed both their available storage space and their respective peak hour No-Build maximum queue length by more than 10 feet:

- Eastbound University Drive through movement exceeds storage space by 17 feet in AM only
- Northbound Ivy Creek Boulevard right turn exceeds storage space by 23 feet in AM and by 129 feet in PM
- Westbound University Drive through movement exceeds storage space by 41 feet in PM only

For the NHC 2/NHC LPA Alternative, the maximum queues for the eastbound and westbound through movements are expected to slightly exceed the available storage space, although the additional queue will reach unsignalized intersections and should not cause gridlock at signalized intersections further

upstream. Additionally, the maximum queues are expected to be infrequent events; however, the average queues for all three movements would be well below the storage space and would not reach the upstream signalized intersections. Under the NHC 2/NHC LPA Alternative, two roadway modifications were proposed and included in the design including a dedicated westbound University Drive right turn bay and adding a third eastbound through lane starting on the east side of Ivy Creek Boulevard and continuing through Martin Luther King Jr Parkway. With these lane additions, the width of University Drive with the LRT located in the median would be approximately 135 feet. Adding an additional westbound through lane would increase the crossing distance of University Drive further and would also cause the LRT preemption events to have a longer duration; as such, this is not recommended.

6.1.2 University Drive at Larchmont Road

The City of Durham - Compact Neighborhood traffic impact criteria are applied to the unsignalized intersection of University Drive at Larchmont Drive, as both roadways are under city jurisdiction. Due to alignment differences, the two Build LRT Alternatives report different delays, LOS, and queue lengths at this intersection. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection delays during both peak hours would meet the City of Durham thresholds.

The NHC 1 Alternative meets all City of Durham traffic impact criteria for individual movements including delay, LOS, and maximum queue lengths during the AM and PM Peak Hours.

The NHC 2/NHC LPA Alternative's eastbound University Drive through movement would experience a degradation to LOS F during the AM peak hour only, due to downstream congestion and queuing expected at University Drive and Martin Luther King Jr Parkway.

There are no maximum queue impacts expected under the NHC 1 Alternative.

For the 2040 NHC 2/NHC LPA Alternative, the maximum queue length for the following movements will exceed both their available storage space and their respective peak hour No-Build maximum queue length by more than 10 feet:

- Eastbound University Drive through movement exceeds storage space by 21 feet in AM only

The maximum queue length, which would be an infrequent occurrence, for the eastbound through movement would slightly exceed the available storage space by the length of a car to reach the upstream signalized intersection of University Drive and Ivy Creek Boulevard. However, the average queue for this movement is well below the available storage space.

6.1.3 University Drive at Martin Luther King Jr. Parkway

The NCDOT traffic impact criteria are applied to the intersection of University Drive at Martin Luther King Jr. Parkway, as Martin Luther King Jr. Parkway is under NCDOT jurisdiction. Due to alignment differences, the two Build LRT Alternatives report different delays, LOS, and queue lengths at this intersection. For the 2040 LRT NHC 1 Alternative, the overall intersection delays during both peak hours would meet the NCDOT delay/LOS thresholds. The 2040 LRT NHC 2/NHC LPA Alternative is expected to experience an overall LOS degradation from LOS D to E in the AM peak hour only.

For the LRT NHC 1 Alternative, three individual movements are expected to operate with degraded LOS of middle D or worse including the northbound Martin Luther King Jr. Parkway left turn in the PM peak hour only, the northbound Martin Luther King Jr. Parkway through movement in the AM and PM peak hours, and the westbound University Drive through movement in the AM peak hour only.

For the LRT NHC 2/NHC LPA Alternative, several individual movements are expected to operate with degraded LOS of middle D or worse including the northbound Martin Luther King Jr. Parkway left turn in the PM peak hour only, the northbound Martin Luther King Jr. Parkway through movement in the AM and PM peak hours, the southbound Martin Luther King Jr. Parkway through movement in the PM peak hour only, the southbound Martin Luther King Jr. Parkway left turn in the AM peak hour, the westbound University Drive through movement in the PM peak hour only, and the westbound University Drive left turn in the AM and PM peak hours. The southbound Martin Luther King Jr. Parkway left turn experiences an increase in delay greater than 25% in the PM peak hour while maintaining the same LOS F as in the No-Build Conditions.

For the 2040 LRT NHC 1 Alternative, the maximum queue length for the following movements will exceed both their available storage space and their respective peak hour No-Build maximum queue length by more than 10 feet:

- Southbound Martin Luther King Jr. Parkway left turn exceeds storage space by 176 feet in AM only
- Westbound University Drive through movement exceeds storage space by 205 feet in PM only
- Westbound University Drive left turn exceeds storage space by 221 feet in PM only

The southbound Martin Luther King Jr. Parkway left turn maximum queue length would exceed the dedicated turn bay, but it would be contained within the southbound approach. The westbound approach's maximum queue lengths could potentially block the unsignalized intersection with Lyckan Parkway; however, the maximum queues would not interfere with the LRT as it crosses westbound University Drive between Lyckan Parkway and Westgate Drive. The 2040 NHC 1 Alternative PM peak hour would experience increased maximum queue lengths, however, the increase in maximum queue lengths would be less than 40 feet compared to the No-Build Conditions. The eastbound University Drive left turn to northbound Martin Luther King Jr. Parkway would realize an LOS improvement and the overall intersection LOS would improve from E to D. Additionally, all three movements that indicated maximum queue impacts report average queue lengths well below the available storage space except for the westbound University Drive through movement during the PM peak hour, which has an average queue that exceeds the storage space by only 10 feet.

Modifications to the roadway to address traffic operations issues have been included in the NHC 1 design, including the provision of a dedicated westbound University Drive right turn bay. It was also assumed that some volume would divert from northbound Martin Luther King Jr. Parkway right turn to the northbound Shannon Road movement at University Drive due to substantial congestion expected at Westgate Drive and University Drive to the east. To prevent the southbound Martin Luther King Jr. Parkway left turn maximum queue from spilling into the adjacent lane, there are three options: increase the storage space of the existing single left turn bay, add a second southbound left turn bay, or prohibit the southbound left turn movement. The first two options would require the realignment of Martin Luther King Jr. Parkway, while the left turn prohibition could potentially be accomplished by rerouting vehicles originating from the north to Chapel Hill Boulevard (US 15-501 Business). These and other

University Drive Traffic Simulation Report

mitigation strategies can be evaluated during the Engineering phase of the project to determine the appropriate strategy at University Drive and Martin Luther King Jr. Parkway.

For the 2040 LRT NHC 2/NHC LPA Alternative, the maximum queue length for the following movements will exceed both their available storage space and their respective peak hour No-Build maximum queue length by more than 10 feet:

- Southbound Martin Luther King Jr. Parkway left turn exceeds storage space by 649 feet in AM only
- Westbound University Drive through movement exceeds storage space by 101 feet in AM only
- Westbound University Drive left turn exceeds storage space by 189 feet in AM only
- Westbound University Drive right turn exceeds storage space by 134 feet in AM and by 262 feet in PM

For the Westbound University Drive through and left turn movements, their average queue lengths are expected to be well below the available storage space, however, the southbound MLK Jr. Parkway left turn in the AM peak hour, and the westbound University Drive right turn in the PM peak hour only report average queue lengths that would slightly exceed the storage space by 10 feet or less. The southbound Martin Luther King Jr. Parkway left turn maximum and average queues may exceed the available turn bay storage space, but the queues would be contained by the adjacent southbound through movement before reaching the merge of the eastbound US 15-501 Business on-ramp and mainline US 15-501. The westbound right turn maximum and average queue lengths may extend beyond the unsignalized Lyckan Parkway intersection in the 2040 PM peak hour, however, it would be contained by the westbound approach without reaching a signalized intersection upstream.

Modifications to the roadway to address traffic operations issues have been included in the NHC 2/NHC LPA design, including the provision of a dedicated westbound University Drive right turn bay that would extend east to Westgate Drive. It was also assumed that some volume would divert from the northbound Martin Luther King Jr. Parkway right turn to the northbound Shannon Road movement at University Drive due to substantial congestion expected at Westgate Drive and University Drive to the east. To prevent the southbound Martin Luther King Jr. Parkway left turn maximum queue from spilling into the adjacent lane, there are three remaining options: increase the storage space of the existing single left turn bay; add a second southbound left turn bay; or prohibit the southbound left turn movement. The first two options would require the realignment of Martin Luther King Jr. Parkway, while the left turn prohibition could potentially be accomplished by rerouting vehicles originating from the north to Chapel Hill Boulevard (US 15-501). These and other mitigation strategies can be evaluated during the Engineering phase of the project to determine the appropriate strategy at University Drive and Martin Luther King Jr. Parkway.

It should be noted that all of these impacted movements also exceed the available storage space under the No-Build Conditions.

6.1.4 University Drive at Lyckan Parkway

The City of Durham - Compact Neighborhood traffic impact criteria are applied to the unsignalized intersection of University Drive at Lyckan Parkway, as both roadways are under city jurisdiction. Due to alignment differences, the two Build LRT Alternatives report different delays, LOS, and queue lengths at

University Drive Traffic Simulation Report

this intersection. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection delays during both peak hours would meet the City of Durham thresholds.

Under the LRT NHC 1 Alternative, only the northbound Parkway Plaza driveway left turn would degrade from LOS E in the No-Build to LOS F in the Build PM peak hour only.

For the LRT NHC 2/NHC LPA Alternative, only the westbound University Drive through movement would experience a degradation in LOS from A to F.

For the 2040 LRT NHC 1 Alternative, the maximum queue length for the following movement will exceed both the available storage space and the respective peak hour No-Build maximum queue length by more than 10 feet:

- Eastbound University Drive left turn exceeds storage space by 214 feet in AM only

The eastbound University Drive left turn to northbound Lyckan Parkway would share a turn bay with the eastbound University Drive left turn to northbound Westgate Drive, which would experience substantial congestion and queueing in the future Build and No-Build Conditions. The two queues from the consecutive left turns would combine to create a larger queue. Secondly, preemption events that would occur at the crossing of Lyckan Parkway would provide more delay to the eastbound University Drive left turn. To increase storage capacity for these consecutive eastbound University Drive left turns, a third eastbound University Drive travel lane is proposed between Martin Luther King Jr. Parkway and Lyckan Parkway, which would then transition to become the outer of two eastbound left turn lanes at Westgate Drive.

For the 2040 LRT NHC 2/NHC LPA Alternative, the maximum queue length for the following movements will exceed both their available storage space and their respective peak hour No-Build maximum queue length by more than 10 feet:

- Eastbound University Drive right turn exceeds storage space by 53 feet in AM only
- Eastbound University Drive through movement exceeds storage space by 53 feet in AM only
- Westbound University Drive through movement exceeds storage space by 104 feet in PM only
- Westbound University Drive right turn exceeds storage space by 104 feet in PM only

Although the maximum queues for the above movements could potentially reach the upstream intersections of Westgate Drive and Martin Luther King Jr. Parkway, the maximum queue events are infrequent occurrences. The average queue lengths for these impacted movements would be well below the available storage space. It should be noted that the westbound through and right turn movements also exceed the available storage space under the No-Build conditions.

Similar to the NHC 1 Alternative, the congestion expected at the downstream intersection of University Drive and Westgate Drive would impact the intersection at Lyckan Parkway. For the NHC 2/NHC LPA Alternative, a third eastbound travel lane is proposed along University Drive between Martin Luther King Jr. Parkway and Lyckan Parkway, which would then transition to become the outer of two eastbound left turn lanes at Westgate Drive. An additional westbound shared through/right lane is also proposed between Westgate Drive and Martin Luther King Jr. Parkway.

6.1.5 University Drive at Westgate Drive

The City of Durham - Compact Neighborhood traffic impact criteria are applied to the signalized intersection of University Drive at Westgate Drive, as both roadways are under city jurisdiction. Due to alignment differences, the two Build LRT Alternatives report different delays, LOS, and queue lengths at this intersection. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection delays during both peak hours would meet the City of Durham thresholds.

Under the LRT NHC 1 Alternative, the eastbound University Drive left turn in the PM peak hour only, the northbound Westgate Drive through movement in the AM and PM peak hours, and the southbound Westgate Drive through movement in the AM and PM peak hours would degrade to LOS F and be considered traffic impacts according to city criteria.

For the LRT NHC 2/NHC LPA Alternative, the northbound Westgate Drive left turn in the PM peak hour only, the northbound Westgate Drive through movement in the PM peak hour only, the southbound Westgate Drive through movement in the AM and PM peak hours, and the westbound University Drive through movement would all degrade to LOS F and be considered traffic impacts according to City of Durham criteria.

For the 2040 LRT NHC 1 Alternative, the maximum queue length for the following movement will exceed both the available storage space and the respective peak hour No-Build maximum queue length by more than 10 feet:

- Eastbound University Drive left turn exceeds storage space by 94 feet in AM, however, the maximum queue is only 37 feet longer than the No-Build queue length
- Northbound Westgate Drive left turn exceeds storage space by 62 feet in AM and 55 feet in the PM, however, the No-Build queue is only 17 feet shorter in the PM
- Southbound Westgate Drive right turn exceeds storage space by 159 feet in PM only
- Southbound Westgate Drive through movement exceeds storage space by 25 feet in AM and 276 feet in PM
- Southbound Westgate Drive left turn movement exceeds storage space by 25 feet in AM and 276 feet in PM
- Westbound University Drive through movement exceeds storage space by 146 feet in PM only, however, the Build PM queue is only 26 feet longer than the No-Build maximum queue length
- Westbound University Drive through movement exceeds storage space by 92 feet in PM only, however, the Build PM queue is only 25 feet longer than the No-Build maximum queue length

The northbound Westgate left turn is below 75 vehicles per hour, the southbound Westgate Drive through movement is less than 20 vehicles per hour in AM and less than 100 in PM. The average queues for the impacted movements can be accommodated within the available storage space. All practical roadway modifications were included in the NHC 1 Alternative including the addition of a second eastbound University Drive left turn and extending the bay's length to Martin Luther King Jr. Parkway. In the westbound direction, a dedicated right turn bay is proposed between the Westgate Shopping Center driveway and Westgate Drive. Lastly, it was assumed that as the eastbound University Drive left turn delays and queues increase, drivers would divert to another street to continue north. The eastbound University Drive left turn volumes were reduced to provide a volume-to-capacity ratio that was less than 1.05. During the PM peak hour, 92 total vehicles were deducted from the eastbound University Drive left turn to northbound Westgate Drive and were reassigned to the eastbound University Drive left turn

University Drive Traffic Simulation Report

to northbound Shannon Road. The diverted vehicles would be expected to divert to Shannon Road and continue to points north by either making an eastbound left turn or northbound through movement.

For the 2040 LRT NHC 2/NHC LPA Alternative, the maximum queue length for the following movements will exceed both their available storage space and their respective peak hour No-Build maximum queue length by more than 10 feet:

- Eastbound University Drive left turn exceeds storage space by 148 feet in AM only
- Northbound Westgate Drive left turn exceeds storage space by 66 feet in AM and by 71 feet in PM
- Southbound Westgate Drive right turn exceeds storage space by 79 feet in PM only
- Southbound Westgate Drive through movement exceeds storage space by 94 feet in AM and by 275 feet in PM
- Southbound Westgate Drive left turn exceeds storage space by 94 feet in AM and by 275 feet in PM
- Westbound University Drive left turn exceeds storage space by 68 feet in PM only

All of the above movements' average queues will be less than the available storage space except that the northbound Westgate Drive left turn average queue exceeds the driveway storage space in the PM peak hour only; however, the average and maximum queues will be contained within the larger parking lot. The southbound maximum queue may extend beyond the unsignalized intersection with the South Square Mall southern frontage road; however, the maximum queue would not reach the signalized intersection with the northern South Square Mall driveway. The queue and delay impacts experienced at the north and southbound approaches are partially due to the primary allocation of green time to the major east/west phases to minimize queueing along University Drive, while sacrificing traffic operations for the north/southbound approaches. The westbound University Drive left turn maximum queue length may extend beyond the upstream unsignalized intersection at Westgate Shopping Center, however, this is an unsignalized intersection with right-in/right-out access only and therefore gridlock should not occur.

As with the NHC 1 Alternative, all practical roadway modifications were included in the NHC 2/NHC LPA Alternative including adding a second eastbound University Drive left turn and extending the bay's length to Martin Luther King Jr. Parkway. In the westbound direction, a dedicated right turn bay is proposed between the Westgate Shopping Center driveway and Westgate Drive. Lastly, it was assumed that as the eastbound University Drive left turn delays and queues increase, drivers would divert to another street to continue north. The eastbound University Drive left turn volumes were reduced to provide a volume-to-capacity ratio that was less than 1.05. During the AM and PM peak hours, 92 vehicles and 201 vehicles, respectively, were deducted from the eastbound University Drive left turn to northbound Westgate Drive and were reassigned to the eastbound University Drive left turn to northbound Shannon Road. The diverted vehicles would be expected to divert to Shannon Road and continue to points north by either making an eastbound University Drive left turn or northbound through movement at Shannon Road.

It should be noted that majority of the movements listed above also exceed the available storage space under the 2040 No-Build Conditions.

6.1.6 University Drive at Westgate Shopping Center

The City of Durham - Compact Neighborhood traffic impact criteria are applied to the unsignalized intersection of University Drive at Westgate Shopping Center, as both roadways are under city jurisdiction. The alignment and roadway configurations for LRT NHC Alternative 1 and LRT NHC Alternative 2/LPA are consistent at this intersection. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection and individual movement delays during both peak hours would meet the City of Durham thresholds.

For the 2040 LRT NHC 2/NHC LPA Alternative only, the maximum queue length for the following movement will exceed both its available storage space and the respective peak hour No-Build maximum queue length by more than 10 feet:

- Westbound University Drive through movement exceeds storage space by 255 feet in the PM only, however, the Build PM queue is only 57 feet longer than the No-Build maximum queue length

Although the maximum queue length exceeds the storage space for the westbound University Drive through movement, this is considered a rare occurrence and the same movement's average queue would be far shorter than the available storage space. A third westbound University Drive lane is proposed between Westgate Shopping Center and Westgate Drive to provide additional capacity and storage space for both NHC 1 and NHC 2/NHC LPA Alternatives. As this is an unsignalized intersection, the added queues are a result of downstream congestion at Westgate Drive.

It should be noted that the westbound through movement exceeds the available storage space under the 2040 No-Build conditions.

6.1.7 University Drive at Shannon Road

The City of Durham - Compact Neighborhood traffic impact criteria are applied to the intersection of University Drive at Shannon Road, as both roadways are under city jurisdiction. The alignment and roadway configurations for LRT NHC Alternative 1 and LRT NHC Alternative 2/NHC LPA are consistent at this intersection. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection delays during both peak hours would meet the City of Durham thresholds.

For both 2040 LRT Alternatives, two individual movements are expected to operate with degraded LOS of middle D or worse including the northbound Shannon Road left turn in the PM peak hour and the northbound Shannon Road through movement in the PM peak hour. The additional delay experienced is partially caused by the LRT crossing, and partially due to the additional volume expected to divert from the eastbound University Drive left turn volume from Westgate Drive to Shannon Road. The overall intersection would experience a degradation to a low LOS E; however, this grade is acceptable under City of Durham traffic impact criteria. Additionally, there are no maximum queue impacts expected at the intersection of University Drive and Shannon Road.

6.1.8 Pickett Road at Petty Road

The City of Durham - Compact Neighborhood traffic impact criteria are applied to the intersection of Pickett Road at Petty Road, as both roadways are under city jurisdiction. The alignment and roadway configurations for LRT NHC Alternative 1 and LRT NHC Alternative 2/NHC LPA are consistent at this

intersection. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection and individual movement delays during both peak hours would meet the City of Durham thresholds.

For both 2040 LRT Alternatives, the maximum queue length for the following movement will exceed both its available storage space and the respective peak hour No-Build maximum queue length by more than 10 feet:

- Westbound Pickett Road through movement exceeds the shared left/through/right lane storage space by 220 feet in the AM and by 50 feet in the PM
- Westbound Pickett Road left turn exceeds the shared left/through/right lane storage space by 220 feet in the AM and by 50 feet in the PM
- Westbound Pickett Road right turn exceeds the shared left/through/right lane storage space by 220 feet in the AM and by 15 feet in the PM

The intersection of Pickett Road and Petty Road is located approximately 450 feet from the LRT tracks proposed to cross Pickett Road to the east near Tower Boulevard. During LRT preemption events, the eastbound Pickett Road through movement at Tower Boulevard would be stopped to allow the train to cross the roadway uninterrupted, and as a result eastbound Pickett Road vehicles queue at Tower Boulevard and spillback to Petty Road preventing southbound Petty Road left turn, eastbound Pickett road through movement, and the northbound Petty Road right turn vehicles from continuing onto eastbound Pickett Road. The westbound approach movements with maximum queue lengths in excess of the storage space have average queue lengths that are all less than 15 feet. If required, a dedicated westbound Pickett Road right bay could be evaluated during the Engineering phase of the project.

6.1.9 Pickett Road at Tower Boulevard

The City of Durham - Compact Neighborhood traffic impact criteria are applied to the intersection of Pickett Road at Tower Boulevard, as both roadways are under city jurisdiction. The alignment and roadway configurations for LRT NHC Alternative 1 and LRT NHC Alternative 2/NHC LPA are consistent at this intersection. The intersection control is proposed to be modified from the existing one-way stop control to signalized control to improve the northbound approach performance under the 2040 Build conditions. For both the 2040 LRT NHC 1 and 2040 LRT NHC 2/NHC LPA Alternatives, the overall intersection delays during both peak hours would meet the City of Durham thresholds.

For the LRT NHC 2/NHC LPA Alternative, the northbound Tower Boulevard left turn in the AM peak hour only, would degrade to LOS F and be considered a traffic impact.

For both 2040 LRT Alternatives, the maximum queue length for the following movement will exceed both its available storage space and the respective peak hour No-Build maximum queue length by more than 10 feet:

- Eastbound Pickett Road right turn exceeds the shared through/right lane storage space by 183 feet in the AM and by 125 feet in the PM
- Eastbound Pickett Road through movement exceeds the shared through/right lane storage space by 198 feet in the AM and by 182 feet in the PM
- Northbound Tower Boulevard left turn exceeds the storage space by 93 feet in the AM and by 90 feet in the PM

University Drive Traffic Simulation Report

- Westbound Pickett Road left turn exceeds the storage space by 201 feet in the AM and by 318 feet in the PM

During LRT preemption events, the eastbound Pickett Road through movement, the eastbound Pickett Road right turn, the westbound Pickett Road left turn, the westbound Pickett Road through movement and the northbound Tower Boulevard right turn would all be stopped to allow the train to cross the roadway uninterrupted, and as a result many of these movements will experience queuing. Although the maximum queue lengths exceed the storage space for the above movements, these are considered rare occurrences and the same movements average queue lengths would be far shorter than the available storage space. The northbound Tower Boulevard left turn maximum queue may extend beyond the unsignalized intersection of Tower Boulevard and Conifer Glen Lane to the south; however, the queue would not reach the signalized intersection to the south over 1,000 feet away. Similarly, the westbound Pickett Road left turn maximum queue may extend upstream beyond the unsignalized intersection at Pickett Park; however, the queue could be contained in the two-way left turn lane or the westbound through lanes across the intersection. A dedicated northbound Tower Boulevard right turn bay is proposed in the NHC 1 and NHC 2/NHC LPA designs. If mitigation is required for the eastbound approach, a dedicated eastbound Pickett Road right bay could be evaluated during the Engineering phase of the project to determine if the maximum queue lengths would be reduced.

7. Conclusions/Recommendations

To address the vehicular traffic operations issues identified during the course of the Vissim analysis, this report recommends substantial roadway modifications such as additional through lanes on segments of University Drive and additional turn bays at intersections, which are presented in Table ES-1. With these modifications, the 2040 Build LRT Alternatives' Vissim results indicate that the majority of overall intersections will not result in traffic impacts according to NCDOT or City of Durham guidelines, and the majority of maximum queues would be contained within the proposed turn lanes as described in the following paragraphs.

It should be noted that the subject segment of University Drive is within an LRT station area and the station area is expected to be designated as a compact neighborhood with design district building standards. As such, it is important to balance roadway modifications to increase traffic capacity with the need to build a transportation network that is conducive to multi-modal travel, and is safe and inviting for people who are walking, riding bicycles, or riding transit both along University Drive and across it. Additional analyses and coordination with the City of Durham and NCDOT will be completed during the Engineering phase of the project in order to refine the recommendations contained in this report.

The Build LRT Alternatives Vissim analysis indicates that the anticipated delay and queue increases are primarily caused by three factors:

- Minimum green times and clearance intervals required increases for 2040 Build conditions due to larger intersection widths required to accommodate the LRT.
- Due to the proposed Park-and-Ride lot and multiple turn restrictions, future demand Build vehicular volumes will increase beyond the already substantial No-Build volumes for the eastbound University Drive left turn to Westgate Drive and several other critical movements at this intersection. These heavier build volumes are anticipated to worsen the bottleneck expected under No-Build Conditions along the University Drive corridor. Prior to the incorporation of mitigation measures, the eastbound University Drive left turn queues were observed to spill back to Martin Luther King Jr. Parkway and would frequently block the southbound Martin Luther King Jr. Parkway left turn and eastbound University Drive through traffic at Martin Luther King Jr. Parkway.
- Signal preemption events would interrupt signal coordination along University Drive due to LRT operations. The signal preemption that allows the LRT to travel through intersections without stopping would incur delay for conflicting movements; however, decreasing signal LRT priority by allowing LRV stops at signalized intersections would not noticeably improve vehicular operations as the same conflicting vehicular phases must be stopped during the LRT crossing.

As noted previously, the roadway modifications presented in Table ES-1 are recommended to address these traffic operations issues.

The overall intersection results of the No-Build versus Build Vissim analysis are shown in Table ES-2. The majority of intersections would operate in accordance with NCDOT and City of Durham standards under the Build LRT Alternatives with the roadway modifications recommended in Table ES-1. Only under the NHC 2/NHC LPA Alternative is a single overall intersection expected to be considered a traffic impact:

University Drive Traffic Simulation Report

- University Drive at Martin Luther King Jr. Parkway (NHC 2/NHC LPA), which is expected to degrade from LOS D to LOS E in the AM peak hour

The Vissim results also indicate that the traffic impacts and operational efficiencies are comparable at most of the intersections along University Drive and Pickett Road between the NHC 1 and NHC 2/NHC LPA alternatives. There are several more individual movements that report delay and maximum queue impacts along University Drive at Ivy Creek Boulevard, Larchmont Road, and Martin Luther King Jr. Parkway due to the alignment of the LRT under NHC 2/NHC LPA Alternatives.

Maximum queues would exceed available storage in several locations; however these are considered infrequent occurrences and additional roadway modifications are not recommended at these locations due to the limited operational benefits that would require large capital expenditures via impractical right-of-way acquisitions and would further increase roadway widths. Many of the turn bay maximum queues would also be contained within their overall approaches' storage space and therefore would not impact upstream intersections. For both alternatives, the expected average queues would be accommodated by the available storage at all locations except for the westbound University Drive through movement at Martin Luther King Jr. Parkway in the PM peak hour for Alternative 1, the westbound University Drive right turn at Martin Luther King Jr. Parkway in the PM peak hour under Alternative 2, the southbound Martin Luther King Jr. Parkway left turn at University Drive in the AM peak hour for Alternative 2, and the northbound Westgate Drive left turn at University Drive in the PM peak hour under Alternative 2. However, all of these average queue lengths mentioned above exceed the respective storage space by 10 feet or less.

As noted previously, extensive mitigation measures were incorporated into the LRT designs including additional University Drive through lanes and new turn bays, and additional roadway expansion is not recommended. Additional analysis of traffic impacts and the potential for additional traffic diversion from University Drive may be investigated during the Engineering phase of the project. In addition, proposed roadway modifications will be coordinated with the Durham City-County Planning Department during the Engineering phase to incorporate the forthcoming urban street standards for compact design districts. Other non-geometric mitigation strategies will also be explored by Triangle Transit and coordinated with the City of Durham, including evaluation and development of Travel Demand Management programs to encourage further mode shifts from driving to transit and non-motorized travel in the station areas.

Figure 2: Sheet 9 of 9	2-13

1. Introduction

The proposed Triangle Transit Durham-Orange Light Rail Transit Draft Environmental Impact Statement (D-O LRT Draft EIS) will address existing and future transportation conditions along the proposed corridor and quantify the transportation impacts of the No-Build and Build Alternatives as well as some transportation system management (TSM) improvements. For the purposes of this study the No-Build and TSM scenarios will be combined. The project will potentially have transportation and traffic impacts that will include impacts to streets and highways, bikeways, parking, railroad operations, and public transit.

Following is a description of the proposed methodology for evaluating the potential impacts to traffic and transportation services and facilities that could occur due to the implementation of the proposed D-O LRT. This proposal includes analysis methodologies used to describe existing and future travel patterns and the transportation environment, estimation of forecast year traffic volumes under the No-Build and Build Alternatives, and the analysis of impacts of the light rail operations at intersections and railroad/highway at-grade crossings.

Generally, data required for the traffic and transportation analyses will be developed by the study team, or will be provided by either Triangle Transit, the Town of Chapel Hill, City of Durham, Durham-Chapel Hill-Carrboro Metropolitan Planning Organization (DCHC MPO), or the North Carolina Department of Transportation (NCDOT). Data from other agencies, if needed, is noted in the task descriptions. Triangle Transit will provide information on existing and planned transit services and performance. Existing conditions traffic data from the previous Alternatives Analysis (AA) study will be utilized for the base year analysis and future year volumes will be developed based on travel demand analysis completed by other members of the project teams. The analysis will include both regional travel demand data as well as specific transit route ridership forecasts. The base year for the analysis will be 2011 and the design year will be 2040 in order to be consistent with the DCHC MPO's *2040 Metropolitan Transportation Plan*.

The project team will use the Triangle Regional Travel Demand Model V5 (TRTDM) for this project. The model is based on the traditional four-step travel demand process of trip generation, trip distribution, mode split, and traffic assignment. Documentation for the model development and calibration process is maintained by NCDOT and the Institute for Transportation Research and Engineering (ITRE).

2. Existing Conditions

Following is a description of the elements that will be used to define existing transportation conditions, and the procedures to be used in developing that definition.

Calibrated base models will be constructed and validated using VisSim. The calibration and validation process is described below. For this study 2011 will serve as the base year for analysis.

2.1 Identification Of Simulation Areas

Specific segments of the D-O LRT corridor where the proposed LRT interacts with the roadway network will be analyzed. Along much of the D-O LRT corridor the track is not at grade or is routed in areas that are not near the roadway network. As such, there is no interaction between the proposed D-O LRT and the current or planned roadway network. The segments that are proposed for analysis are as follows:

- Mason Farm Road – East Drive to US 15-501
- NC 54 – Hamilton Road to Downing Creek including Prestwick Road and Meadowmont Lane (Alternative C-1)
- Leigh Village – Includes crossings of proposed Leigh Village as well as Ephesus Church Road and Farrington Road intersection if needed
- Patterson Place – McFarland Drive from Mt. Moriah Road to Witherspoon Boulevard as well as any crossing of Garrett Road
- South Square – Including University Drive from Snow Creek Trail to Shannon Road, Shannon Road from University Drive to US 15-501, and Tower Road from US 15-501 northbound ramps to Pickett Road
- Cornwallis Road – At Grade crossing near US 15/501 (as needed)
- Erwin Road – Cameron Drive to Anderson Street/15th Street, Fulton Street and Trent Drive, and Elba Street as needed
- Pettigrew Street – Erwin Road/9th Street to Sumter Street and Chapel Hill Street to Alston Avenue and proximate intersections as needed
- Peabody Street – Gregson Street to Duke Street

Maps of the proposed simulation areas and intersections are shown in Figures 1 and 2. The selection of the studied areas and intersection was based on the results from the AA. Potential changes to alignment and subsequently crossings may require revision and correction of the current selection.

2.2 Balanced Volume Data

For the traffic analysis portion of the D-O LRT Draft EIS we will employ the data collected as part of the AA phase of the project, including peak hour turning movements for all intersections identified. Traffic counts from 2008 or before will be increased based on the growth of background traffic to represent base year conditions. If significant changes in street configuration or roadway geometry have occurred since the count was taken then newer counts in these areas reflecting such changes will be collected and used for the traffic analysis.

Background growth will be based on data from the NCDOT traffic volume maps (<http://www.ncdot.gov/travel/statemapping/trafficvolumemaps/>). After developing the raw peak hour turning volumes for the base year, the volumes will be balanced across the networks. Sink and source nodes will be added where necessary to account for mid-block changes in traffic volumes due to major origins or destinations. Input data for the loading points will be developed based on the balanced volumes.

2.3 Model Development

For the development of the base model in VisSim, the following will be completed:

- Develop base data including acceleration, speed distributions, vehicle classes, vehicle distributions, and link behavior types
- Develop link geometric data
- Input traffic demand data based on outcome of previous step
- Input origin-destination routing
- Input traffic control data at intersections, including signal timings
- Input traffic operations and management data for links
- Input driver behavior data
- Set simulation run control
- Code network outputs

Data Needs:

Signal Plans from Chapel Hill, Durham, and NCDOT

2.4 Pedestrian And Bicycle Volumes

Where necessary, pedestrian and bicycle data will be collected and utilized in the model stream. To guide this effort, *Effects of Pedestrians on Capacity of Signalized Intersections* by Milazzo et al published in Transportation Research Record 1646 was reviewed. This article serves as the basis for determining the impact of pedestrians on saturation flow rates at signalized intersections as described in chapter 31 of the *2010 Highway Capacity Manual* published by the Transportation Research Board. In that review it was found that pedestrian conflicts reduce saturation flow in a linear manner from 0 to 1000 conflicting pedestrians per hour of green time. The reduction in saturation flow at 1000 conflicting pedestrians per hour of green time is 50%. A threshold of 20% reduction in saturation flow rate will be utilized for this analysis based on the previously referenced items. This 20% reduction

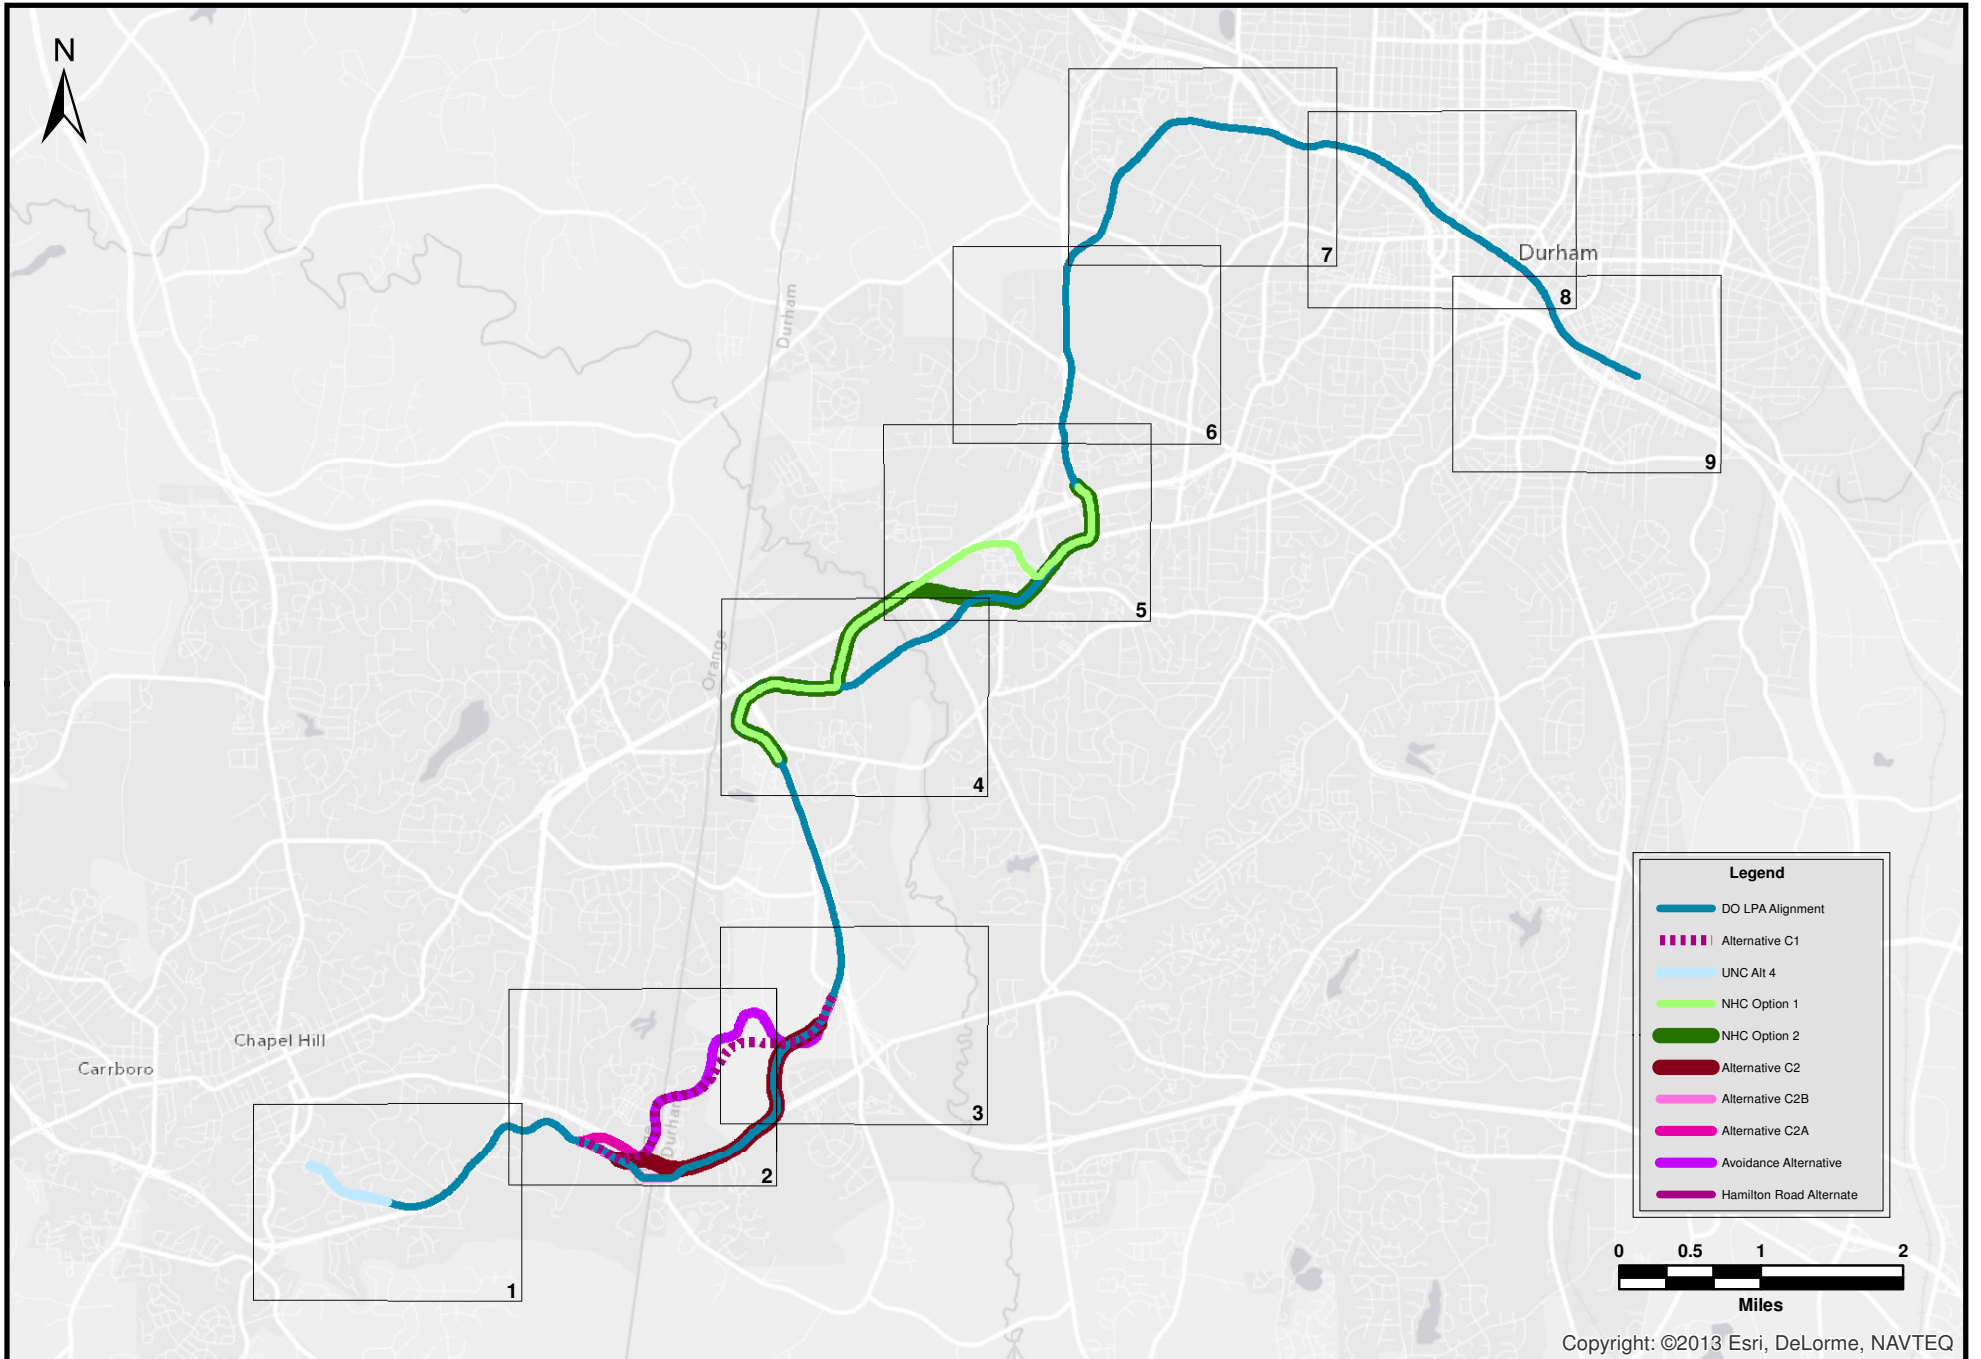

threshold corresponds to 400 conflicting pedestrians per hour of green time. If a conservative assumption is made that turning movements are provided green time equal to 25% of the cycle length, then we can interpolate that for a 20% reduction in turning movement saturation flow rate there must be at least 100 conflicting pedestrians for that particular movement in the peak hour. As such, we are proposing to include only pedestrian movements in the simulation where pedestrian volumes are greater than 100 conflicting pedestrians in the peak hour. To reach that threshold either the volume of conflicting pedestrians on a single crosswalk must be greater than 100 pedestrians in the peak hour or the combined volume of conflicting pedestrians of two adjacent crosswalks must be greater than 100 pedestrians in the peak hour.

A partial field review was conducted to determine locations where pedestrian and bicycle volumes were above the 100 pedestrians per hour threshold. Initial review of the proposed areas revealed that the intersection of Erwin Road and Fulton Street meets this threshold in the base year. Additional examination will be conducted later.

2.5 Calibration Of Model

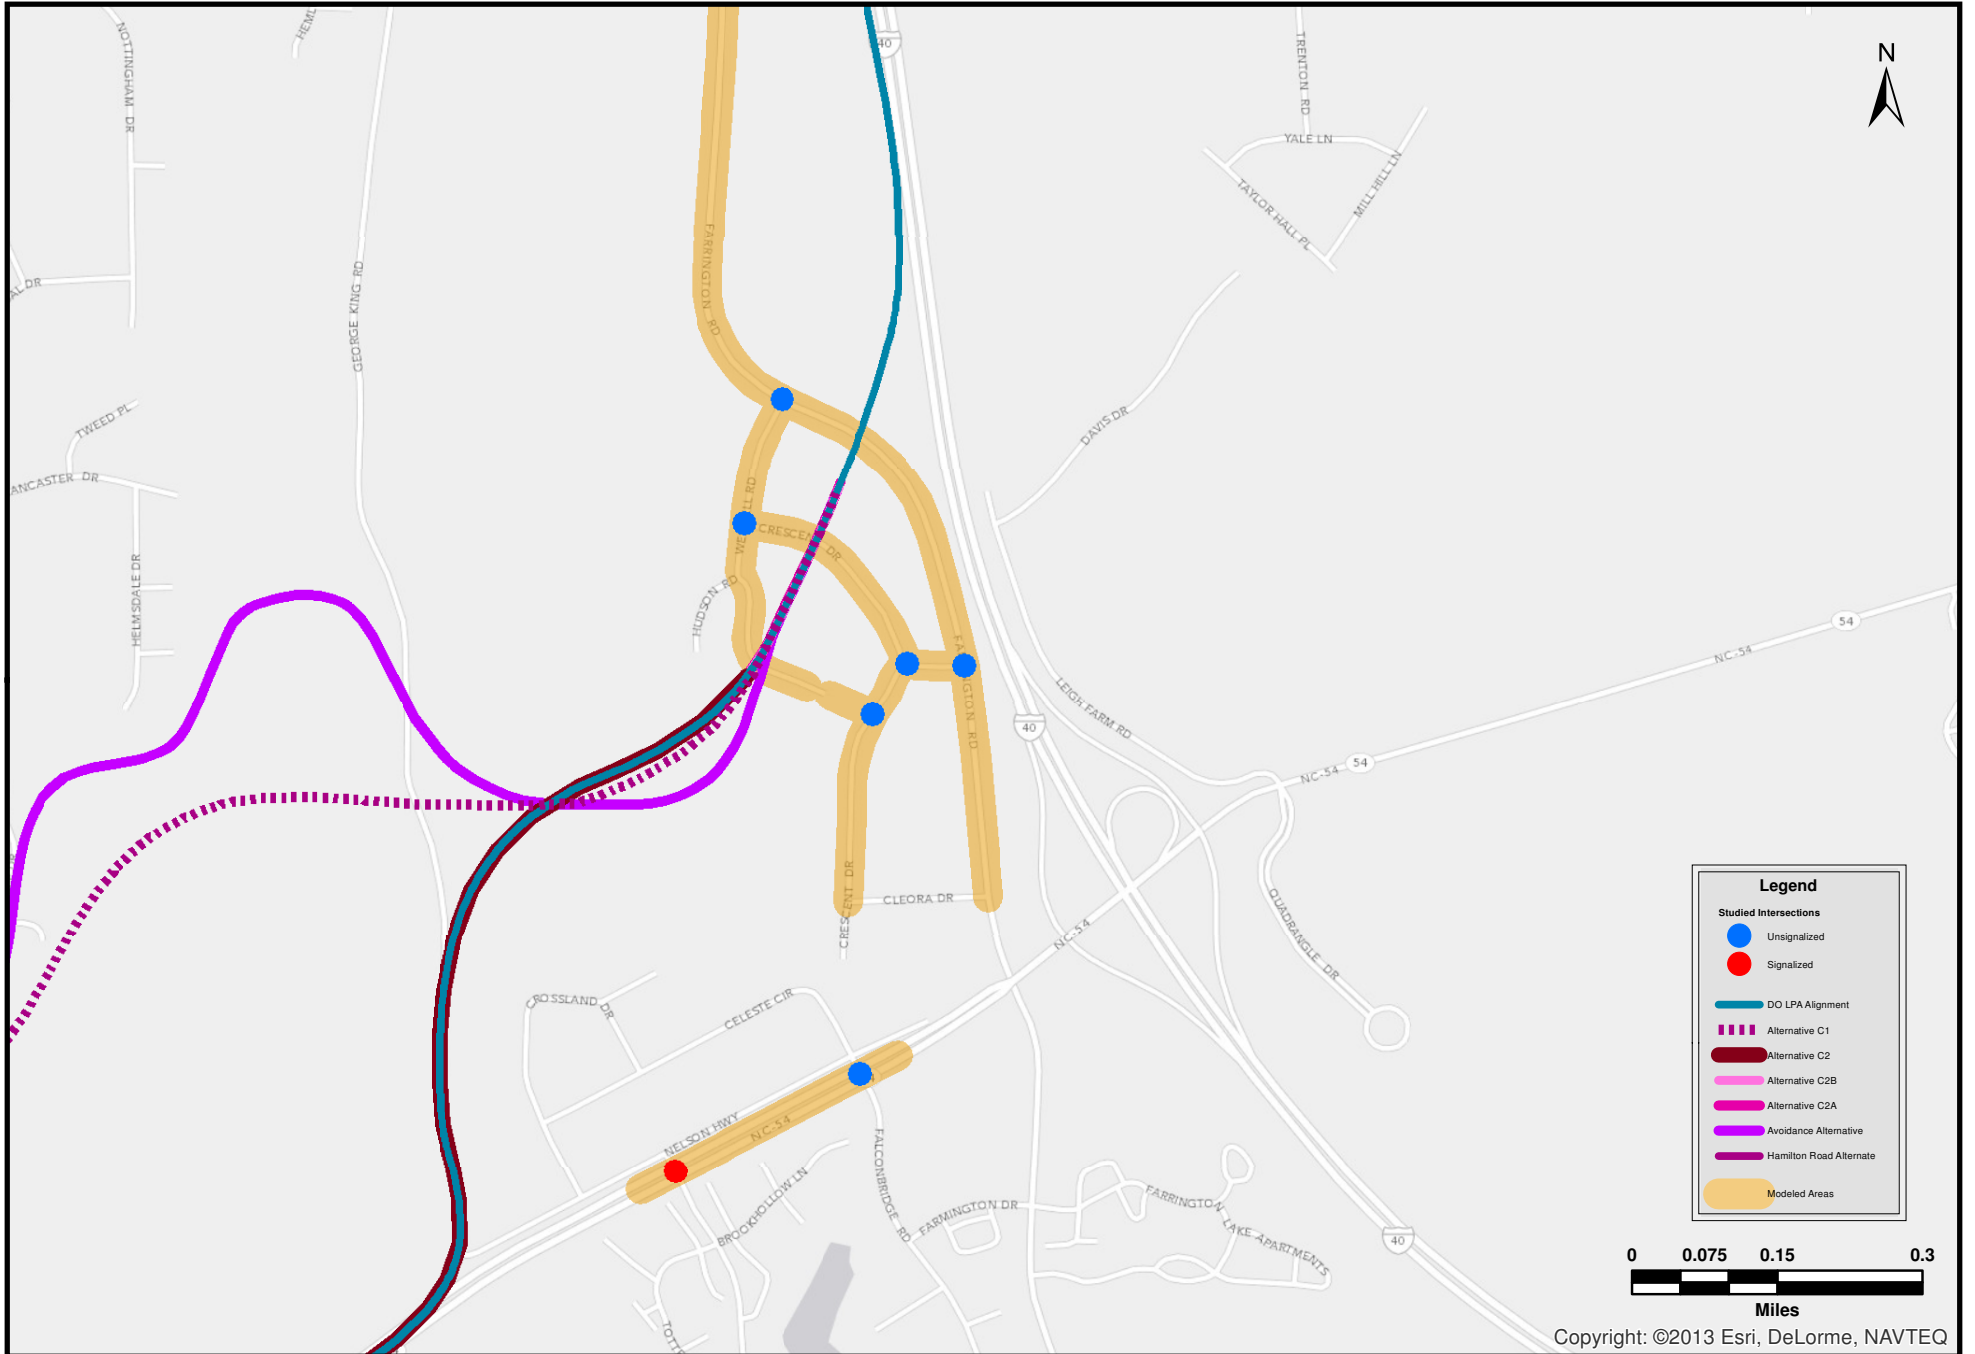

Once the model is created and visually validated, model data will be extracted to ensure that the model is accurately representing base year conditions. The model will be pre-loaded for 15 minutes with volumes that are 75% of those anticipated for the peak hour. Model outputs will be compared to INRIX traffic data from the base year to ensure relatively similar travel times. The models will be considered calibrated when the travel speeds are within 5 mph of the data obtained from INRIX. That said, reasonable efforts will be made to reduce the difference between model travel time speeds and INRIX data to be within 2.5 mph. Given that INRIX data is aggregated over a period of time and that the model run is for one specific day it may not be possible to achieve the narrower band for the purposes of calibration. The model will be run for a sufficient number of iterations to ensure calibration based on Federal Highway Administration (FHWA) guidelines. The number of iterations necessary to achieve calibration for each corridor will be recorded and future year models will be run utilizing the same number of iterations. Models will be run using static trip assignment.

Figure 2, Sheet 7 of 9

3. Future Year No-Build/TSM Model

The No-Build and TSM alternatives are being combined as the traffic volumes are expected to be roughly similar. A future year No-Build/TSM model will be developed for each of the areas identified in section 2.1. These models will examine future conditions that could occur if the D-O LRT line were not constructed. As part of this analysis some projected deficiencies of the roadway network could be discovered. This analysis will not aim to categorize those deficiencies or to develop mitigation strategies. This analysis will be limited to determining likely future year conditions.

3.1 Develop Future Year No-Build/Tsm Volume Data

The balanced volumes developed for the base year analysis will be employed as the starting point for developing the future year No-Build/TSM volume data. Based on the balanced base-year peak-hour turning-movement, data link volumes will be generated for both the AM and PM peak hours. Data from the TRTDM will be used to obtain an appropriate growth factor for every link and this growth factor will be applied to base year link volumes to forecast future year No-Build/TSM peak-hour link volumes for the AM and PM peak hours. Data utilized for this will include daily volume growth, daily percentage growth, peak hour volume growth, and peak hour percentage growth. It will be critical to examine the peak hour data as well as the daily volume data as some peak spreading is likely to occur along the D-O LRT corridor given the developed nature of the corridor and the limited right-of-way available for additional roadway expansion. Engineering judgment will be employed to ensure that appropriate growth rates are extracted from the model.

Growth rates and projected link volumes will be reviewed in light of planned improvements in the area including projected development and changes to parking and transit operations. The model will be reviewed to determine which changes may have already been included within the socio-economic assumptions in the TRTDM. Forecasted link volumes will then be adjusted as necessary to reflect known changes that were not captured in the TRTDM.

Peak-hour turning volumes will be forecasted based on the peak-hour link volumes. Using the *TurnsW32* program (<http://www.kittelsohn.com/toolbox/turnsw32>) and the future year peak-hour link volumes and the base-year turning movements as input data, future year turning movements will be generated. These volumes will then be balanced in a manner similar to that used in the base year, although this process is likely to be less intensive.

Lastly, the sink and source nodes developed for the base year will be revisited. Based on existing development, planned development, and, to a lesser extent, sink and source nodes for the future year, a No-Build/TSM scenario will be developed.

3.2 Pedestrian And Bicycle Volumes

Local pedestrian and bicycle plans will be examined and proposed improvements that intersect the corridor will be noted. Qualitative estimates of the extent to which pedestrian and bicycle traffic will interact with the roadway network will be developed based on base year conditions and proposed developments. For this analysis cyclists will be assumed to cross at crosswalks and will not be included in the vehicular flow. At those locations where pedestrian and bicycle traffic is expected to be above the 100 conflicting pedestrians per hour data will be developed and added to the model. The intersection Erwin Road and Fulton Street will include pedestrian or bicycle flow data in keeping with the base year calibration process. Additional intersections, particularly in downtown Durham or near either of the major college campuses, may also include pedestrian data in the future year No-Build/TSM analysis.

3.3 Future Year No-Build/Tsm Model Development

The base year model will be updated based on expected improvements to the roadway network. For this process the State Transportation Improvement Plan (STIP), the Metropolitan Transportation Improvement Plan (MTIP), various Capitol Improvement Plans (CIP), and bond packages will be reviewed to ensure that anticipated improvements are included in the future year model network. Unsignalized intersections will be given a cursory examination to determine if signalization is appropriate for future year conditions based on the volumes developed in the previous steps.

Signal timings will be updated using either Synchro or Vistro and the projected volumes and geometries. These new timings will be added to the model. Regardless of the development of pedestrian and bicycle data from the previous step all signals will be optimized to allow for safe pedestrian crossings.

Lastly routing information will be updated as needed to reflect changes in the roadway network based on proposed changes.

3.4 Model Simulation And Output Extraction

Upon developing the future year No-Build/TSM model, the model will run for the number of iterations necessary to achieve base year calibration. Models will be run using static trip assignments. The following data will be extracted and analyzed:

- Intersection Level of Service (LOS)
- Queuing
- Control delay
- Travel time
- Travel speeds
- Network delay (total and average per vehicle)

3.5 Comparison To Synchro

The Synchro analysis completed in the Alternative Analysis phase will be updated with new traffic volumes. The data from Synchro will be compared to the VisSim output. Differences will be noted and explained.

4. Future Year Build Models

A future year Build model will be developed for each of the areas identified in section 2.1. As noted in section 3.0 this analysis may reveal potential deficiencies in the future year roadway network. Only those areas negatively impacted above a certain threshold will be identified as part of this analysis. Areas anticipated to be deficient regardless of construction of the D-O LRT will not be identified nor will any potential mitigation strategy be developed.

4.1 Develop Future Year Build Volume Data

The balanced volumes developed for the future year No-Build/TSM analysis will be used as the starting point for developing the future year build volume data. Based on the balanced future-year No-Build/TSM turning-movement data, peak-hour link volumes will be generated for both the AM and PM peak hours. Data from the TRTDM will be used to obtain an appropriate diversion factor for every link for the AM and PM peak hours. Data utilized for this will include daily volume diversion, daily percentage diversion, peak hour volume diversion, and peak hour percentage diversion. It will be critical to examine the peak hour data as well as the daily data as some peak spreading is likely to occur along the D-O LRT corridor given the developed nature of the corridor and the limited right-of-way available for additional roadway expansion. Engineering judgment will be employed to ensure that appropriate growth rates are extracted from the model. A check will also be done between the Build and No-Build/TSM volume data to see if patterns suggested by the TRTDM are reflected in the volume data.

Growth rates and projected link volumes will be reviewed in light of planned improvements in the area including projected development and changes to parking and transit operations. The model will be reviewed to determine which changes may have already been included within the socio-economic assumptions in the TRTDM. Forecasted link volumes will then be adjusted as necessary to reflect known changes that were not captured in the TRTDM.

Peak-hour turning volumes will be forecast based on the peak-hour link volumes. Using the *TurnsW32* program (<http://www.kittelson.com/toolbox/turnsw32>) and the future year peak hour link volumes and the base year turning movements as input data future year turning movements will be generated. These volumes will then be balanced in a manner similar to that used in the base year, although this process is likely to be less intensive.

Lastly, the sink and source nodes developed for the base year will be revisited. Based on existing development, planned development, and, to a lesser extent, sink and source nodes for the future year, a Build scenario will be developed.

4.2 Pedestrian And Bicycle Volumes

In addition to data collected in section 3.2, station area data and ridership information will be examined to determine which areas may need to include pedestrian and bicycle flows in the analysis. The increase in pedestrian traffic due to the proposed D-O LRT will be above and beyond any increase due to future year land use. Qualitative estimates of pedestrian and bicycle flows will be developed based on base year conditions and proposed developments. In keeping with the future year No-Build/TSM analysis cyclists will be assumed to cross at crosswalks and will not be included in the vehicular flow. At those locations where pedestrians and bicycles are expected to be above the 100 conflicting pedestrians in the peak hour, data will be developed and added to the model.

4.3 Future Year Build Model Development

The future year Build model will be updated based on the proposed D-O LRT. Unsignalized intersections will be given a cursory examination to determine if signalization is appropriate for future year conditions based on the volumes developed in the previous steps.

Prior to signal optimization the project team will meet with local officials to discuss preferred interactions between the LRT and nearby signals. This will include discussions of both transit signal priority (TSP) and pre-emption. An interaction strategy for each individual signal will be identified.

Signal timings will be updated utilizing either Synchro or Vistro and the projected volumes and geometries and interaction strategy. These new timings will be added to the model. Regardless of the development of pedestrian and bicycle data from the previous step all signals will be optimized to allow for safe pedestrian crossings.

Lastly routing information will be updated as needed to reflect changes in the roadway network based on proposed changes.

4.4 Model Simulation And Output Extraction

Upon developing the future year Build model, the model will run for the number of iteration necessary to achieve base year calibration. Models will be run utilizing static trip assignment. The following data will be extracted and analyzed:

- Intersection LOS
- Queuing
- Control delay
- Travel time
- Travel speeds
- Network delay (total and average per vehicle)

4.5 Identify D-O LRT Impacts

Future year build output will be compared to future year no-build data. Those intersections that are expected to increase delay above a certain threshold will be identified. For the purposes of this study NCDOT's Policy on Street and Driveway, Chapter 5, Section J will be used to identify intersections on facilities owned by NCDOT and in the Town of Chapel Hill. The *Durham Comprehensive Plan Policy 8.1.2a, Traffic Level of Service (LOS) Standards* from the City of Durham will be applied to identify intersections on facilities owned by the City of Durham. Mitigation strategies to address the degradation in LOS and control delay will be developed for those identified intersections in the next phase of the project.

5. Friday Center Drive and Barbee Chapel Road Grade Separation Analysis

A grade separation analysis will be conducted to determine the benefit of grade separating the LRT crossings at Friday Center Drive and Barbee Chapel Road, both near NC 54. These locations were determined based on an analysis completed during the AA portion of the project and due to recent adjustments to the proposed D-O LRT alignment. The AA included a high level review of grade-separated and at-grade crossings and made definitive recommendations for the other crossings. The analysis for the Friday Center Drive and Barbee Chapel Road crossings could not be completed during the AA phase because of the more limited data available in this phase. This analysis will include altering the future year build network in the area to include a grade separated LRT crossing at Friday Center Drive. The model will then be re-run and new data will be extracted. The new model run data will be compared to the previous future year build data to determine the benefits of grade separating at this crossing. If necessary the analysis will review both alternative C1 and C2 to determine the benefits of grade separation.

6. Mitigation Plan

As noted above, a list of intersections expected to experience an increase in control above given thresholds will be developed. To reduce the impact of the D-O LRT, mitigation strategies will be identified for these locations. Such strategies could include additional turn lanes, improvements to alternative paths, alterations to travel patterns reducing delay, and improvements that do not add capacity such as improved wayfinding. These strategies will be tested utilizing VisSim to the extent possible. The modeled networks will be altered to include the roadway improvements or, in the case of strategies that alter travel patterns, the routing and volume data will be adjusted to reflect those new paths. The effectiveness of the strategies will be determined based on model results.

While the sections simulated are generally corridors, it is possible that some mitigation strategies may include the creation or improvement of alternative paths. Such an improvement may require the use of dynamic traffic assignment. A previously proposed mitigation strategy that would create an alternative path is the conversion of the Trent Drive and Elba Street intersection from the current configuration to a roundabout. Currently traffic on northbound Trent Drive cannot continue to westbound Elba Street. The conversion of this intersection to a roundabout would allow traffic on northbound Trent Drive to continue to westbound Elba Street. This conversion would provide an alternative path to the right-turning traffic from westbound Erwin Road to northbound Fulton Street, thus allowing this stream of traffic the opportunity to bypass the Erwin Road and Fulton Street intersection.

For this potential improvement, as well as similar improvements that create alternative paths, we are proposing to continue the use of static traffic assignment. Routing decisions will be updated such that traffic will be diverted to the new route and the model will be re-run and data on travel times extracted. The congested travel time of the new path will be compared to the existing path for the runs with the shifted traffic. If the travel time for the new path is still less than that for the existing path then no additional analysis will be required. In a case like this dynamic traffic assignment would shift all traffic to the new path as it is the shortest path. If the travel time for the new path is greater than the travel time for the existing path then dynamic traffic assignment will be used to provide the appropriate balance between traffic that will use the new path and traffic that will use the existing path. It is under this, and only this, condition that dynamic traffic assignment would be employed.

- NOTES:
- (1) NEW TRAFFIC SIGNAL CITY INV. 957
 - (2) POLES BASES ARE NOT EXACT, SHALL BE FIELD LOCATED BY DUKE POWER
 - (3) MAST ARM, BASE INSTALLATION BY OTHERS
 - (4) CONTROLLER SHALL BE PROGRAMMED TO START UP/AT Ø2+6 GREEN
 - (5) CABINET SHOULD BE PLACED SO AS NOT TO OBSTRUCT SIGHT DISTANCE OF VEHICLES TURNING RIGHT ON RED
 - (6) SEE PAVEMENT MARKING PLANS FOR LOCATION OF PAVEMENT MARKINGS
 - (7) COORDINATE LOOP DETECTOR PLACEMENT WITH PAVEMENT MARKINGS AS SHOWN ON PAVEMENT MARKING PLANS
 - (8) ALL UNDERGROUND UTILITIES AND CULVERTS SHOULD BE LOCATED PRIOR TO ANY INSTALLATION
 - (9) WHEN IN FLASHING MODE, ALL SIGNALS HEADS FOR THE SAME APPROACH SHALL FLASH CONCURRENTLY
 - (10) CABINET SHOULD BE MOUNTED TO PERMIT ACCESS FROM ALL DOORS
 - (11) DETECTOR GREEN OVERRIDE ON LOOPS 3A, 3C SHALL BE CONNECTED TO THEIR GIVEN GREEN PHASE
 - (12) PROGRAM CONTROLLER FOR ANTI-BACKUP ON Ø2+5, Ø1+6
 - (13) LOOPS 1A, 2B ARE QUADRUPOLE
 - (14) PROGRAM PHASE 4 & 8 FOR DUAL ENTRY.
 - (15) AUDIBLE PED. SIGNAL SHALL CONFORM TO NCDOT SPECS. FOR SOUNDS.

EDI MODEL 2010ECL CONFLICT MONITOR

PROGRAMMING DETAIL

- NOTES:
- Card is provided with all diode jumpers in place. Removal of any jumper allows its channels to run concurrently.
 - Make sure jumpers SEL1-SEL5 are present on the monitor board.

NOTES

- TO PREVENT "FLASH-CONFLICT" PROBLEMS, INSERT RED FLASH PROGRAM BLOCKS FOR ALL UNUSED VEHICLE LOAD SWITCHES IN OUTPUT FILE. VERIFY THAT SIGNAL HEADS FLASH IN ACCORDANCE WITH THE SIGNAL PLANS.
 - TO PREVENT RED FAILURES ON UNUSED MONITOR CHANNELS, SEE RED MONITOR BOARD PROGRAMMING DETAIL THIS SHEET.
 - PROGRAM CONTROLLER TO START UP IN PHASES 2 AND 6 GREEN.
 - SET POWER-UP FLASH TIME TO 10 SECONDS AND IMPLEMENT WITHIN THE CONTROLLER PROGRAMMING.
 - ENABLE SIMULTANEOUS GAP-OUT FEATURE, ON CONTROLLER UNIT, FOR ALL PHASES.
 - PROGRAM PHASES 4 AND 8, ON CONTROLLER UNIT, FOR DOUBLE ENTRY.
7. THE CONTROLLER AND CABINET ARE PROGRAMMED AND WIRED INTO THE CITY OF DURHAM'S COMPUTERIZED SIGNAL SYSTEM. THE CONTRACTOR IS RESPONSIBLE FOR THE PROPER INTERCONNECTION AND OPERATION OF THIS SIGNAL WITHIN THE SYSTEM.

EDIMODEL 2010ECL CONFLICT MONITOR

PROGRAMMING DETAIL

NOTES

- To prevent "flash-conflict" problems, insert red flash program blocks for all unused vehicle load switches in the output file. The installer shall verify that signal heads flash in accordance with the Signal Plans.
- To prevent red failures on unused monitor channels, see Red Monitor Board Programming this sheet.
- Program controller to start up in phases 2 and 6 green.
- Set power-up flash time to 7 seconds and implement within the controller programming.
- Enable simultaneous gap-out feature, on the controller unit, for all phases.
- Ensure start up flash phases are coordinated with flash program block assignments.
- This controller and cabinet are part of the Durham City System.

RED MONITOR BOARD PROGRAMMING

(position jumpers as shown below)

xSYSTEM DETECTOR PROGRAMMING NOTES

In order for system loops to operate properly, their pin assignments will have to be re-assigned on 170E controller as described below.

A. To assure that these pins are cleared from their default function, program as follows:
Keypad input E/126+4.7 = 0
Keypad input E/126+4.F = 0

B. Program pins for system detectors as follows:
Keypad input E/126+B+1 = 66
Keypad input E/126+B+2 = 79

Detector Types
 EXTENTION: Detector only active during the Phase Green Interval
 COUNT: used in computing "Added Initial
 CALL: Detector only active during the non green phase will not extend the phases
 TYPE 3: will allow a call detector to extend its phase until the call first drops or the type 3 limit is reached

NOTES

- THIS SIGNAL IS TO BE PART OF THE DURHAM COMPUTERIZED SIGNAL SYSTEM.
- PAVEMENT MARKINGS ARE EXISTING.
- ALL WORK SHALL BE DONE IN ACCORDANCE WITH THE 1993 NCDOT TRAFFIC SIGNAL SPECIFICATIONS, AND ANY SUBSEQUENT ADDENDA.
- MAXIMUM TIMES SHOWN IN TIMING CHART ARE FOR FREE-RUN OPERATION ONLY. COORDINATED SIGNAL SYSTEM TIMING VALUES SHALL SUPERSEDE THESE VALUES.
- SIGNAL TO FLASH FROM 11:00 PM UNTIL 6:00 AM UNLESS OTHERWISE DIRECTED BY THE ENGINEER.
- WHEN IN FLASH MODE, ALL SIGNAL HEADS FOR THE SAME APPROACH SHALL FLASH CONCURRENTLY.
- SIGNAL TIMINGS ARE COORDINATED BY THE DURHAM CITY SYSTEM.
- LOOP TO BE LOCATED SLIGHTLY BEHIND LEADING EDGE OF STOP LINE.
- THESE 2 CROSSWALKS TO BE INSTALLED AFTER WIDENING OF THE SOUTH LEG OF THE INTERSECTION.
- PROPOSED WIDENING OF SOUTH LEG OF INTERSECTION. LOOPS 3A, 8A & 8B NOT TO BE INSTALLED UNTIL SOUTH LEG OF INTERSECTION IS COMPLETED.
- OMIT PHASE 1 DURING PHASE 2 ON, OMIT PHASE 5 DURING PHASE 6 ON.
- CONTROLLER SHALL BE PROGRAM TO CLEAR FROM PHASE 2 & 6 TO PHASE 1 & 5 BY PROGRESSING THROUGH PHASE 4 & 8 (SEE ELECTRICAL DETAILS FOR PROGRAM.)
- SIGN B MAY BE REMOVED AT THE DISCRETION OF ENGINEER.

**EDI MODEL 2010ECL-NC CONFLICT MONITOR
PROGRAMMING DETAIL**

(remove jumpers and set switches as shown)

NOTES:

1. Card is provided with all diode jumpers in place. Removal of any jumper allows its channels to run concurrently.
2. Make sure jumpers SEL2-SEL5 are present on the monitor board.

NOTES

1. TO PREVENT "FLASH-CONFLICT" PROBLEMS, INSERT RED FLASH PROGRAM BLOCKS FOR ALL UNUSED VEHICLE LOAD SWITCHES IN THE OUTPUT FILE. VERIFY THAT SIGNAL HEADS FLASH IN ACCORDANCE WITH THE SIGNAL PLANS.
2. ENSURE THAT RED ENABLE IS ACTIVE AT ALL TIMES DURING NORMAL OPERATION. TO PREVENT RED FAILURES ON UNUSED MONITOR CHANNELS, TIE UNUSED RED MONITOR INPUTS 1,3,5,7,9,10,11,12,13,14,15 & 16 TO LOAD SWITCH AC+ PER THE CABINET MANUFACTURER'S INSTRUCTIONS.
3. PROGRAM CONTROLLER TO START UP IN PHASES 2 AND 6 GREEN.
4. SET POWER-UP FLASH TIME TO 10 SECONDS AND IMPLEMENT WITHIN THE CONTROLLER PROGRAMMING.
5. ENABLE SIMULTANEOUS GAP-OUT FEATURE, ON CONTROLLER UNIT, FOR ALL PHASES.
6. PROGRAM PHASES 4 AND 8, ON CONTROLLER UNIT, FOR DOUBLE ENTRY.
7. SET ALL DETECTOR CARD CHANNELS TO 'PRESENCE' MODE.
8. THIS CABINET AND CONTROLLER ARE TO BE WIRED AND PROGRAMMED AS PART OF THE DURHAM CITY SIGNAL SYSTEM.

NOTE: PROGRAM DETECTOR DELAY AND CARRYOVER TIMES AS SPECIFIED ON SIGNAL DESIGN PLANS.

***SYSTEM DETECTOR PROGRAMMING NOTES**

IN ORDER FOR SYSTEM LOOPS TO OPERATE PROPERLY, THEIR PIN ASSIGNMENTS WILL HAVE TO BE RE-ASSIGNED ON I70E CONTROLLER AS DESCRIBED BELOW.

A. IN ORDER TO ASSURE THAT THESE PINS ARE CLEARED FROM THEIR DEFAULT FUNCTION, PROGRAM AS FOLLOWS:

PIN 60 - E/126+4+1=0
 PIN 62 - E/126+4+3=0

B. AFTER FOLLOWING STEP 'A' ABOVE, PROGRAM PINS FOR SYSTEM DETECTORS AS FOLLOWS:

SYS1 - E/126+B+1=60
 SYS2 - E/126+B+2=62

NOTES:

1. THE CONTRACTOR SHALL INSTALL TRANSCEIVER MODEL IFS D9130 FOR COMPATIBILITY WITH EXISTING SYSTEM.
2. TRANSCEIVER TERMINATION CONFIGURATIONS ARE GENERIC. CONTRACTOR IS RESPONSIBLE FOR DETERMINING / ENSURING PROPER TERMINATIONS.
3. THE CONTRACTOR SHALL NOTIFY THE CITY OF DURHAM TRAFFIC ENGINEERING DEPARTMENT (LARRY McGLOTHLIN, 919-560-4366) PRIOR TO BEGINNING WORK. ANY REVISIONS TO THE CABLE ROUTING AND SPLICE PLANS SHALL BE APPROVED BY THE ENGINEER PRIOR TO BEGINNING WORK. THE CONTRACTOR SHALL PROVIDE ALL AS-BUILT CABLE ROUTING AND SPLICE PLANS TO THE CITY OF DURHAM BEFORE ACCEPTANCE OF THE PROJECT.
4. THE CONTRACTOR IS RESPONSIBLE FOR MAINTAINING / ASSURING STABLE COMMUNICATIONS FROM PICKETT DR. AT WESTERN BYPASS UP TO DURHAM CHAPEL HILL BLVD. (BUS 15 501) AND WESTGATE. AND BACK TO THE DURHAM TRAFFIC OPERATIONS CENTER DURING CONSTRUCTION OF CABLE ROUTING, SPLICING, AND UPON COMPLETION OF THE PROJECT.
